

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

## Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

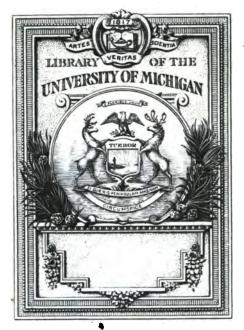

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

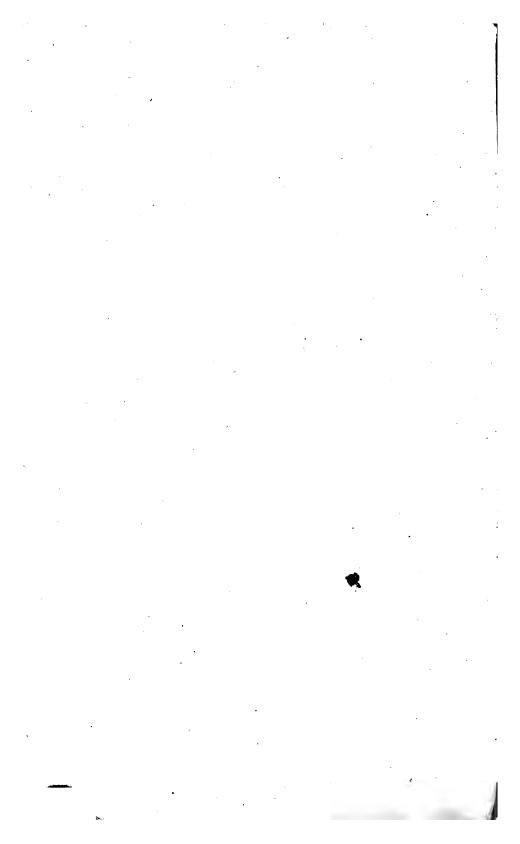

## **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

## PREFACE.

The great use of Tables, for the purpose of facilitating calculations in all the various branches of Mathematics, is so apparently obvious, as to require no comment. There has not, however, been any extensive collection of tables hitherto published; and those in common use being scattered through various works, much time is lost, and a considerable portion of unnecessary expence incurred. In order, therefore, to remove these difficulties, the following Collection has been made; which, it is hoped, will be found useful to students in Universities and Academies; to the practical Navigator, Geographer and Surveyor, and to many others in different departments in life.

Very great attention has been paid to the correction of the press, so that it is presumed few errors have escaped notice; and, as an Explanation of the Tables is prefixed, it is, therefore, hoped, that no difficulty will occur in the manner of using them.

It was the intention of the Author to have added several more scarce and valuable tables, but, by so doing, the work would have been swelled far beyond its intended limits; these additional tables, however, may, probably, appear in a distinct volume, to which this is to be considered as the first.

### ERRATA.

Page 1. Aisla, for Lat. 55° 15′, and Long. 5° 5′, read 55 56. 6 9.

Page 11. Rothesay, for time of high water 11 hours, read 12 hours.

The Binder will observe, that Sig. [D] of the Tables has been omitted—Sig. [E] must therefore immediately follow Sig. [C], being a continuation of Table VIII.

## EXPLANATION OF THE TABLES.

## TABLE I.

## The Latitudes and Longitudes of Places.

THIS table is divided into seven columns; the first column contains the names of the places, ranged in alphabetical order; the second, the continent in which the place is situated, or to which it belongs; the third, the country, province, or island; the fourth, the sea or coast; the fifth and sixth columns contain the latitude and longitude respectively, expressed in degrees and minutes, (the longitude being reckoned from the meridian of Greenwich); and the seventh column contains the time of high water at new and full moon, at those places where there are tides, and where the time is known.

This table is compiled from the requisite Tables, the Philosophical Transactions, the Connaissance des Temps, Exposition du Calcul, and other treatises which, it was presumed, could be depended on. A few of the places also are from the communications of correspondents,\* and from the observations of the author. And he has been careful neither to insert any of those places, whose positions, to him, seemed doubtful; nor places within land, as being unnecessary to the practical seaman, and serving only to increase the bulk of the table, without being of any real utility. Hence, although this table is not so extensive as some others, yet he flatters himself it is as correct as any of the same kind hitherto published, having bestowed great pains for this purpose.

## TABLE II.

## To find the Moon's Age.

By this table, the moon's age is found by inspection only, from the year 1800 until 1894, inclusive; and the method of extending it a few years before or after the limits of the table is obvious.

This table is divided into two parts; the first of which contains the months and days, and the other the years, with the moon's age. In this last part, N stands for new moon, and F for full moon. In order, therefore, to find the moon's age on any given day of any given year, within the limits of the table, find the pro-

The positions of many of those places on the west coast of Scotland, were communicated by Mr. Lamont, of Greenock,

posed day under the given month, then, on the same horizontal line, and under the given year, is the moon's age required. Thus, upon the 17th of October 1880, the moon's age is thirteen days. March 12th, 1869, it is new moon, and on the 18th of the same month, in the year 1878, it is full moon.

The epact for any given year within the limits of the table, is found at the bottom of the column immediately under the given

year. Thus; the epact for the year 1850 is 17.

## TABLES III. AND IV.

## Epacts of Years and Months.

By these tables, the mean age of the moon, at any given time, may be found to the nearest ininute, by adding the epacts of the given year and month, and the proposed time reduced to the meridian of Greenwich. If this sum exceeds a mean lunation, or 29 d. 12 h. 44', deduct it therefrom. The mean time of new moon is found by subtracting the sum of the epacts of the given year and month, from 29 d. 12 h. 44'; but if greater than that quantity, subtract it from 59 d. 1 h. 29', to which add the longitude, in time, if east, but subtract it if west. The mean time of the preceding, or following full moon, is found by subtracting, or adding 14 d. 18 h. 22'; and the quarters, by applying 7 d. 9 h. 11'.

## TABLE V.

Correction to be added to the Time of High Water at any given Place at New and Full Moon, to find the Time of High Water on any other Day of the Moon.

Column t of this table contains the moon's age to every six hours; and the second column contains the corresponding time, to be added to that of high water at full and change, to find the time of high water on the proposed day.

## TABLE VI.

Commission of the second

Equation of the Time of High Water, depending on the angular Distance between the Sun and Moon, and on the Distance of the Moon from the Earth.

In order to ascertain the time of high water at a given place, with any tolerable degree of accuracy, corrections, depending on the angular distance between the sun and moon, and on the distance of the moon from the earth, must be used. The distance, also, of the sun from the earth ought to be taken into account that this last being much less than either of the former is here neglected. In this table, therefore, the combined correction arising from the position of the moon, with respect to the sun in right ascension, and to the earth, is contained. The angular distance in

right ascension, in time, is expressed by the moon's transit; and the distance of the moon from the earth is in the inverse ratio of its horizontal parallax, and both these being readily found by the Nautical Almanac, they are, therefore, adopted as the arguments of the table.

The time of high water at any proposed place, is found by applying the equation from the table answering to the time of transit and horizontal parallax, reduced to the meridian of the given place, according to its title, to the sum of the time of high water at full and change, and the time of transit reduced to the meridian of the given place by Table XXX. This will be the approximate time of high water; and if greater accuracy be required, the time of transit and horizontal parallax are to be again reduced to this time; and the equation answering to these, is to be taken from the table, and applied as before.

## TABLE VII.

The Miles and Parts of a Mile contained in a Degree of Longitude, at each Degree of Latitude.

The first column of this table contains degrees of latitude, and the second column contains the miles and hundredth parts of a mile in a degree of longitude, corresponding thereto: the other columns are a continuation of the first and second. If the given latitude consists of degrees and minutes, a proportional part of the difference between the miles and parts of a mile, answering to the given and following degrees of latitude, is to be found, and subtracted from the miles, &c. answering to the given degree of latitude.

#### EXAMPLE.

Required the number of miles contained in a degree of longiude, in latitude 48° 50?

Miles in a degree of longitude, in latitude 48° = 40.15 in latitude 49° = 39.36

Difference - 79

Then, As 60': 50'::.79:.66 nearly; which, subtracted from 40.15, gives 39.49; the measure of a degree of longitude, in latitude 48° 50'.

The proportional part may be very readily found by the traverse table, as follows. Find that page in the table, in which the given minutes of excess above the next less degree of latitude, in a latitude column, answers to 60 in a distance column; then, opposite to the difference of the numbers in a distance column, is the proportional part in a latitude column. Thus, in the preceding example, 50' in a latitude column, will correspond with 60' in a distance column nearly, under 33°; then, opposite to 79 in a distance column is 66 in a latitude column, the proportional part as before.

This table may be applied to calculations in Parallel and Middle Latitude Sailing. It is a table of natural co-sines, adapted to a ra-

dius of 60.

## TABLE VIII.

## The Logarithms of Numbers.

Logarithms are a set of quantities expressing the measures of the ratios of the terms of another set of quantities or numbers. Or, Logarithms are the indices or exponents of a series of numbers in geometrical progression.\*

Let the following be a series of numbers in geometrical progression, namely, 1. r. r. r. r. r. r. r. r. r. e. &c. And the indices, or o. d. 2d. 3d. 4d. 5d. 6d. &c. will be the logarithms of the corresponding terms, each of each.

By a comparison of the several terms of these serieses, it is evident that 2d + 4d, or 6d, answers to, or is the logarithm of

$$r^{2d} \times r^{4d}$$
, or  $r^{6d}$ . And  $6d - 2d$ , or  $4d$  answers to  $\frac{r^{6d}}{2d}$ , or  $r^{4d}$ 

Also, 
$$\frac{2d+4d}{2}$$
, or 3d, answers to  $\sqrt{r^{2d} \times r^{4d}} = \sqrt{r^{6d}} = r^{3d}$ , &c. And hence, all the various rules for performing Multiplication,

Division, Proportion, Involution, Evolution, &c. by logarithms, are obvious.

Since r and d may be expounded by any numbers whatever, it is, hence, evident, there may be an infinite variety of different kinds of logarithms. Let 10 be substituted for r, and 1 for d, and the serieses become

These are the logarithms in common use, and are called *common logarithms*, in order to distinguish them from other kinds of logarithms.

Hence, in this form of logarithms, the logarithm of 1 is 0, the log. of 10 is 1, the log. of 100 is 2, the log of 1000 is 3, &c. Whence, the logarithm of any term between 1 and 10, being greater than 0, but less than 1, is a proper fraction, and is expressed decimally. The logarithm of each term between 10 and 100 is 1, with a decimal fraction annexed; the logarithm of each term between 100 and 1000 is 2, with a decimal fraction annexed, and so on. The integral part of the logarithm is called the *Index*, or characteristic, and the other the decimal part. The index is, evidently, always one less than the number of figures in the natural number, exclusive of fractions, if there are any in that number.

<sup>\*</sup> Or, Logarithms are a series of numbers so contrived, that the sum of the logarithms of any two numbers, is the logarithm of the product of these numbers. Hence it is inferred that, if a rank, or series of numbers in arithmetical progression, be adapted to a series of numbers in geometrical progression, any term in the arithmetical progression, will be the logarithm of the corresponding term in the geometrical progression.

The index of the logarithm of a number, consisting in whole, or in part of integers, is affirmative; but if the number be a proper fraction, the index is negative, and is usually marked by the sign (—) placed either before or above the index. If the first effective figure of the decimal fraction be adjacent to the decimal point, the index is — 1, or 1: if there is one cypher between them, the index is — 2, or 2: if two cyphers, the index is — 3, or 3. Instead of negative indices, their arithmetical complements are used by many; as by this means the computations are rendered easier, especially to those unacquainted with the first principles of Algebra.

The decimal parts of the logarithms of numbers, consisting of the same figures, are the same, whether the number be integral,

fractional, or mixed. This is illustrated as follows:—

| Number | 189600 | Logarithm |   |   | - | -   | 5.27784   |    |         |
|--------|--------|-----------|---|---|---|-----|-----------|----|---------|
|        | 18960  | - "       | _ | - | - | -   | 4.27784   |    |         |
|        | 1896   | -         | - | - | - | -   | 3.27784   |    |         |
|        | 189.6  | -         | - | - | - |     | 2,27784   |    |         |
|        | 18.96  | -         | - | - | • | -   | 1.27784   |    |         |
|        | 1.89   | 6         | - | - | - | • . | 0.27784   |    |         |
|        | .18    | 96        | - | - | - | _   | - 1.27784 | or | 9.27784 |

|        | .00    | 01896     |   | - | - | _   | - 4.27784 | -  | 6.27784 |
|        | .00    | 00189     | 6 | - | - | -   | - 5.27784 | -  | 5.27784 |

Table VIII. contains the logarithms of all numbers under 10000, extended to five decimal places, which is sufficiently accurate, in most cases, in navigation or practical mathematics. As the index is not prefixed, it must therefore be supplied, which is easily done, being always one less than the number of figures in the natural number.

## PROBLEM I.

To find the logarithm of any given number.

## RULE.

If the number is under 100, its logarithm is found in the first page of the table, immediately opposite thereto.

If the number consists of three figures, find it in the first column of the following part of the table, opposite to which, and under o,

is its logarithm.

If the given number contains four figures, the three first are to be found, as before, in the side column, and under the fourth at the top of the table is the logarithm required; to which, the index

3 is to be prefixed, if the given number is an integer.

If the given number exceeds four figures, find the difference between the logarithms answering to the first four figures of the given number, and the next following logarithm; multiply this difference by the remaining figures in the given number, point off as many figures to the right-hand as there are in the multiplier, and the remainder, added to the logarithm, answering to the first four figures, will be the required logarithm, nearly.

The logarithm of a vulgar-fraction is found by subtracting the logarithm of the denominator from that of the numerator; and that of a mixed quantity is found by reducing it to an improper fraction, and proceeding as before.

## EXAMPLES.

Ŧ.

What is the logarithm of 59?

In the first page of the table, opposite to 59 is 1.77085, the logarithm required.

·II.

Required the logarithm of 365?
Opposite to 365, and under 0, is 2.56229.

III.

Sought the logarithm of 7854?
Opposite to 785, and under 4, is 3.89509.

IV.

Required the logarithm of 186479?

| The logarithm of 1864                  | _           | -  | is | -   | -      | 27045                   |

| 71  | =     | 8       | • | log. | _ | - | - | - | 0.90309 |
| Log | garit | na of 7 |   |      | - | - | - | - | 0.88224 |

## PROBLEM II.

To find the number answering to any given logarithm.

#### RULE.

Find the next less logarithm to that given in the column marked o at the top, and continue the sight along that horizontal line, and a logarithm the same as that given, or very near it, will be found; then the three first figures of the corresponding natural

number will be found opposite thereto in the side column, and the fourth figure immediately above it, at the top of the page. If the index of the given logarithm is 3, the four figures thus found are integers: if the index is 2, the three first figures are integers, and the fourth is a decimal, and so on.

If the given logarithm cannot be exactly found in the table, and if more than four figures be wanted in the corresponding natural number; then find the difference between the given and the next less logarithms, to which annex as many cyphers as there are figures required above four in the natural number; which divide by the difference between the next less, and next greater logarithms, and the quotient annexed to the four figures formerly found, will give the required natural number.

## EXAMPLES.

T

Required the natural number corresponding to the logarithm 2.79477?

This logarithm is found opposite to 623, and under 4; hence, since the index is 2, the corresponding number is 623.4.

IT.

What is the number answering to the logarithm 5.13278? The next less logarithm in the tables is .13258, answering to 1357; the difference between which and the given logarithm is 20, to which two cyphers being annexed, gives 2000: now, this divided by 32, the difference between the next less and next greater logarithms, the quotient is 62, which annexed to 1357, gives 135762, the number required.

#### PROBLEM III.

To perform MULTIPLICATION by Logarithms.

## RULE.

Add the logarithms of the factors, and the sum is the logarithm

of the product.

If there are negative and affirmative indices, their difference is to be taken; or rather use the arithmetical complements \* of the negative indices, and reject tens from the sum of these indices.

#### EXAMPLES.

|         |             | Mult | iply 2 | I.<br>256 | bv : | 12 ? |   |                    |
|---------|-------------|------|--------|-----------|------|------|---|--------------------|
| Factors | { 256<br>13 | -    | log.   | -         | -,   | -    |   | 2.40824<br>1.11394 |
| Product | 3328        | -    |        | _         |      |      | _ | 3.59218            |

<sup>\*</sup> The arithmetical complement of the logarithm of any number, is found by subtracting the given logarithm from that of the radius, or by subtracting each of its figures from 9, except the last, or right-hand figure, which is to be taken from 10. The arithmetical complement of an index is found by subtracting it from 10.

#### EXPLANATION OF THE TABLES.

#### II.

|                 |     |                       |        | 11.  |                   |                 |

## PROBLEM IV.

To perform DIVISION by Logarithms.

## RULE.

From the logarithm of the dividend, subtract the logarithm of the divisor, the remainder is the logarithm of the quotient.

If one or both of the terms are less than unity, remove the decimal points till the factors contain whole numbers, and the dividend the greatest; then, if the dividend be more places removed than the divisor, remove the decimal point of the quotient as many places to the left hand; but if the divisor be more places removed, then remove the decimal point of the quotient as many places to the right hand. If the dividend and divisor be equally removed, the quotient is not to be altered.

### EXAMPLES.

| 1 | r |   |
|---|---|---|
|   |   | _ |
|   |   |   |

| Quotient   | - ·· - | -       | - ,  | 8.771 | -   | -            | - | 0.94304 |

#### PROBLEM V.

To perform PROPORTION by Logarithms.

#### RULE.

From the sum of the logarithms of the second and third terms, subtract the logarithm of the first term, the remainder is the logarithm of the answer.

#### EXAMPLE.

#### T.

If a ship sails 15 knots in 2½ hours, how many miles will she run in 19 hours at the same rate?

| As 2.5    | hours |   | - | log. |   | - | ′ | 0.39794 |
|-----------|-------|---|---|------|---|---|---|---------|
| Is to 19. |       | - | - | -    | - | - | - | 1.27875 |
| So is 15  | miles | - | - | -    | - | - | - | 1.17609 |
| To 114    | miles | _ |   |      |   | _ |   | 205600  |

#### TT.

A merchantman, distant 22 miles, going at the rate of 4½ knots an hour, is pursued by a privateer, whose hourly rate of sailing is 6 knots; after two hours chase the breeze freshened, and the merchantman's rate was encreased to 5.8 knots, and the privateer's to 8.4. In what time will the privateer come up with the merchantman?

As the privateer gained 1½ miles an hour on the merchantman, at the end of the first two hours, the distance between them was 19 miles. During the remaining part of the chase, the hourly advance of the privateer was 2.6 knots. Therefore,

| As the    | hourly rate   | - | 2.6      | - | 0.41497     |
|-----------|---------------|---|----------|---|-------------|
| Is to the | distance      | - | 19.      | - | 1.27875     |
| So is     |               | - | · 1 hour | - | 0.00000     |
|           | ,             |   |          |   | <del></del> |
| To the    | time required |   | 7 908    | - | 0.86978     |

Hence, from the time the breeze freshened, the privateer would come up with the merchantman in 7 h. 18', or 9 h. 18' from the commencement of the chase.

## PROBLEM VI.

To perform INPOLUTION by Logarithms, that is, to find the square, cube, &c. of any given number.

## RULE.

Multiply the logarithm of the given number by the index of the power, and the product is the logarithm of the power sought.

#### EXAMPLES.

| What | is | the | square | of | ٢8 | ? |
|------|----|-----|--------|----|----|---|

| Given nur    |        | 58   | - | lo | g. | - | • | 1.7 | 6343 |
|--------------|--------|------|---|----|----|---|---|-----|------|
| Index of the | he por | wer  | • | -  | -  | - | - | -   | 2    |
| Square       |        | 3364 |   | -  | -  | - | - | 3.5 | 2686 |

#### 11.

## 2. What is the fourth power of 16?

| Given number     | 16    | - | log. | - | - | 1.204 | 12            |
|------------------|-------|---|------|---|---|-------|---------------|
| Index of the pow | rer - | - | •    | - | - | •     | 4             |
| Fourth power     | 65536 | - | •    | - | - | 4.816 | <del>18</del> |

## PROBLEM VII.

To perform EVOLUTION by Logarithms, that is, to extract any proposed root of any given number.

#### RULE.

Divide the logarithm of the given number by the index of the root, the quotient is the logarithm of the root.

If the given number is a decimal, and the arithmetical comple-

ment of the negative index used, prefix 1 to that index for the square root, 2 for the cube-root, &c.

## EXAMPLES.

| ٠, | r |  |
|----|---|--|
|    |   |  |
|    | L |  |

## Required the square-root of 8464?

| Given number | - | 8464 | - | - | - | 3.92758 |
|--------------|---|------|---|---|---|---------|
| Square-root  | - | 92   | - | - | - | 1.96379 |
|              |   |      |   |   |   |         |

#### Ц.

## Required the cube-root of 6896?

| Given number | - | 6896   | - | - | - | 3.83860                   |
|--------------|---|--------|---|---|---|---------------------------|
| Cube-root    | - | 19.033 | - | - | - | .1 <b>.</b> 2795 <b>3</b> |

### PROBLEM VII.

To find the TONNAGE of a Ship by Logarithms, according to the common Method.

#### RULE.

If the vessel is a ship of war, let fall a perpendicular from the fore-side of the stem, at the height of the hause holes; but if a merchantman, the perpendicular is to be let fall from that part of the fore-side of the stem which is at the same height above the keel, as the wing transom: also let fall another perpendicular from the back of the main post, at the height of the wing transom. Find the distance between these two perpendiculars, from which subtract three-fifths of the extreme breadth; and also, the product of the height of the wing transom above the upper edge of the keel, by 2½ inches, and the remainder is the length of the keel for tonnage. To the logarithm of which, add the logarithm of the breadth, and that of the half-breadth, and the constant logarithm 8.02687,\* the sum, rejecting to from the index, will be the logarithm of the tonnage required.

## EXAMPLE.

Let the length between the perpendiculars at the fore-part of the stem, and the back of the post, be 100 feet; the extreme breadth 27½ feet, and the height of the wing transom 15 feet. Required the tonnage?

100 feet

Length between the perpendiculars

| Three-fifths extreme brea<br>Height, wing transom |    | $2\frac{1}{2}$ , c | or =     | 16.8<br><b>3.</b> 1 | 5<br>1 <b>25</b> |      |         |
|---|----|--------------------|----------|---------------------|------------------|------|---------|
| Sum   | -  | -                  | -        | -                   | 19.625           |      | •       |
| Length of keel for touna                          | ge | _                  | <b>.</b> | - '                 | 80.375           | log. | 1.90512 |
| Extreme breadth ' -                               | ٠. | -                  | -        | -                   | 27.5             |      | 1.43933 |
| Half extreme breadth                              | _  | -                  | -        | -                   | 13.75            |      | 1.13830 |
| Constant logarithm                                | -  | -                  | -        | -                   |                  |      | 8.02687 |
| Tonnage   | -  | -                  | -        | -                   | 3 <b>21.3</b>    |      | 2.50962 |

<sup>\*</sup> The arithmetical complement of the logarithm of 94, being the common divisor for finding the tonnage.

## TABLE IX.

To reduce Points of the Compass to Degrees, and conversely.

This table is divided into six columns; in the two first and two last columns, the names of the several points and quarter-points of the compass are contained; the third column contains the corresponding number of points and quarter-points reckoned from the meridian; and the fourth column, the degrees, &c. answering thereto. The manner of using this table is obvious.

## TABLE X.

Logarithmic Sines, Tangents, and Secants, to every Point and Quarter of the Compass.

In making calculations by logarithms relative to a ship's place, as deduced from the course and distance, &c. it will be found more convenient, if the course is given in points, to take the sine, &c. of it from this table, than to reduce the course to degrees, and take the sine, &c. of it from the following table.

The points and quarters are contained in the first and last columns, and the log. sines, tangents, and secants, in the intermediate columns.

## TABLE XI.

Logarithmic Sines, Tangents, and Secants, to each Degree and Minute of the Quadrant.

This table contains the logarithms of the natural sines, tangents, and secants.

The degrees are numbered at the top of the table, in a direct order, from 0° to 45°; and at the bottom of the table, in a retrograde manner, from 45° to 90°. The minutes are contained in the marginal columns; those in the left-hand column belonging to the degree at the top, and the minutes in the right-hand column belonging to the degree at the bottom of the page.

#### PROBLEM I.

To find the sine, co-sine, &c. answering to any given degree and minute.

#### RULE.

Find the given degrees at the top of the page, if less than 45°, and the minutes in the left-hand column; opposite to which, and under the word sine, co-sine, &c. is the quantity required. But, if the given degrees be between 45° and 90°, find them at the bottom, and the required sine, co-sine, &c. will be found above the word sine, co-sine, &c. opposite to the given number of minutes in the right-hand column.

If the given arch exceeds 90°, find the sine, co-sine, &c. of its supplement.

## Examples.

I.

Required the log. sine of 23° 28'?

Under the word sine, in the page marked 23° at the top, and opposite to 28' in the left-hand column, is 9.60012, the sine of 23° 28'?

II.

Required the co-tangent of 57° 9'?

In the page marked 57° at the bottom, above the word co-tangent, and opposite to 9' in the right-hand marginal column, is 9.81003, the co-tangent of 57° 9'.

III.

What is the secant of 138° 50'?

The supplement of 138° 50' is 41° 10', the secant of which is 10.12332. Or, which is the same, the co-secant of 48° 50', the excess of the given arch above 90°, is 10.12332, the secant of 138° 50' as required.

## PROBLEM II.

To find the sine, tangent, &c. of an arch expressed in degrees, minutes, and seconds.

## RULE.

Find the sine, tangent, &c. answering to the given degree and minute, and also that answering to the next greater minute; multiply the difference between them by the given number of seconds, and divide the product by 60; then, the quotient added to the sine, tangent, &c. of the given degree and minute, or subtracted from the co-sine, co-tangent, &c. will give the quantity required, nearly.

If the arch be less than three degrees, it will be necessary to use

the following rule:-

To the arithmetical complement of the given degrees and minutes reduced to seconds, add the logarithm of the given degrees, minutes, and seconds, reduced to seconds, and the log.-sine, tangent, &c. of the given degrees and minutes, the sum, rejecting 10 from the index, will be the log.-sine, tangent, &c. of the proposed number of degrees, minutes, and seconds.

EXAMPLES.

T

Required the log.-sine of 15° 2' 28"?

| Log. sine             | £     | 15° 2′        |         |        | 9           | .41 <b>394</b>  |               |

| 10 36/ 29/            | ٠ ـ   | •             | tangent | -      | -           |                 | 8.44784       |

## PROBLEM III.

To find the degrees and minutes answering to any given log. sine, tangent, &c.

## Rule.

Find in its respective column, the nearest sine, tangent, &c. to that given, and take the degrees from the top or bottom of the page, according as the quantity is found in a column titled at the top or bottom, and the minute is found in the same horizontal line, in the left or right hand marginal columns, according as the quantity is found in a column titled at the top or bottom of the page.

## EXAMPLES.

#### T

Required the degrees and minutes answering to the log. sine 9.49768?

This is found in the column marked sine at the top, under 18 degrees, and opposite to 20 minutes.

#### П.

Required the degrees and minutes answering to the log. tangent 10.35416?

The nearest to this is found in the column titled tangent at the bottom, above 66 degrees, and opposite to 8 minutes.

## PROBLEM IV.

To find the degrees, minutes, and seconds, answering to a given logarithmic sine, tangent, &c.

## RULE.

Find the degrees and minutes answering to the next less logarithmic sine, tangent, &c., which subtract from that given; multiply the remainder by 60, and divide the product by the difference between the next less and next greater logarithms, and the quotient will be the seconds to be annexed to the degrees and minutes before found.

If the given logarithm is that of the sine or tangent of a small arch—then, to the arithmetical complement of the next less logarithm in the tables, add the given logarithm, and the logarithm of the degrees and minutes, in seconds, answering to the next less logarithm, the sum, rejecting radius, will be the logarithm of the number of seconds in the required arch.

## EXAMPLES.

Ī.

Required the arch corresponding to the logarithmic sine 9.25486?

| Given log. | ine   | -   | - | 9.2  | 5486, |   | next ; | greate | er | 9.2 | 55  | 14             |
|------------|-------|-----|---|------|-------|---|--------|--------|----|-----|-----|----------------|
| Next less  | 10° 5 | 217 | - | 9.23 | 5445  | - | - `    | •      |    | 9.2 | 544 | <del>1</del> 5 |
|            |       |     |   |      |       |   |        |        |    |     |     | _              |
| Difference | -     | -   | - | -    | 41    | • | ٠.     | -      | _  | -   | . ( | 59             |

Now, 41 multiplied by 60", and divided by 69, the quotient is 36" nearly; hence the corresponding arch is 10° 21' 36".

#### 11.

## Required the arch answering to the log. tangent 8.31085?

| The   | e next less log, tang | ent in the t | table is | 8.30888, | whic | h answ     | ers |         |

#### TABLE XII.

Traverse Table to Points and Quarters of the Compass.

In this table, the points and quarter points under 4 points, are contained at the top of the table; and those between 4 and 8 points, at the bottom. The first column contains the distance to 60 miles, the second column contains the difference of latitude, and the third the departure, if the course is less than 4 points; but if the course exceeds 4 points, the second column contains the departure, and the third the difference of latitude. The other columns are a continuation of the former, the distance being extended to 300 miles.

If the given distance exceeds 300 miles, collect the several differences of latitude and departures answering to the several distances, that make up the given distance. Thus, Let the course be  $3\frac{1}{4}$  points, and the distance 573 miles.

To course 34 points, and dist. 300, the diff. of lat. is 241.0, and dep. 178.7

Hence, to course \$1 points, and dist. 573, the diff. of lat. is 460.3, and dep. 341.3

## TABLE XIII.

## Traverse Table to each Degree of the Quadrant.

This table is similar to the former in every respect, except that it is adapted to each degree of the quadrant, instead of each point and quarter point of the compass. The degrees under 45° are found at the top of the table, and those between 45° and 90°, at the bottom.

This table, besides its use in navigation, will serve as a general table of proportion, by finding the greatest of the two first terms of the proportion in a distance column, and the other in a latitude or departure column; then, opposite to the third, in a column of the same name with that in which the first term was found, will be the fourth term in a column of the same name as that in which the second term was found.

## EXAMPLES.

Ţ

If a ship sails 8 miles in 3 hours, what distance will she run in a day; and in what time will she run 235 miles, the rate of sailing

being supposed uniform?

Eight in a distance column will be found to correspond with 3 in a departure column, under 22°; then, opposite to 24 in a departure column is 64 miles in a distance column; and opposite to 235 miles in a distance column is 88, or 3 d. 16 h. in a departure column.

#### II.

If a seaman receive 4 guineas per month of 30 days, what will

his wages amount to in 3 months 7 days?

In three months, it is evident, the wages will amount to 121. 12s. Now, for the proportional part answering to the 7 days, find 30 in a distance column, and turn over until 7 is found in a departure column. Under 13° 6.7 is found, and under 14° is 7.3; hence 7 would be found under 13°½. Now, under 13°, and opposite to 84 shillings = 4 guineas, is 18.9 in a departure column; and under 14° and opposite to 84 is 20.3, the mean 19.6 = 19s. 7d., which, added to 12l. 12s. the sum is 13l. 11s. 7d. the answer.\*

<sup>\*</sup> This might have been done, although not with the same degree of exactness, as follows:—In a departure column, 30 will be found opposite to 97 in a distance column, under 18°. Then, opposite to 84 in a departure column, is 272 in a distance column, which reduced to pounds, is 131. 12s. the answer nearly.

## TABLE XIV.

## Meridional Parts.

This table contains the meridional parts answering to each degree and minute of latitude. The degrees are expressed at the top, and the minutes in the marginal column: under the degree, and opposite to the minute in any given latitude, are the meridional parts, and conversely.

This table is used in Mercator's Sailing, and in constructing

charts, agreeable to Mercator's method of projection.

## TABLE XV.

## Dominical Letter.

It has been the custom, particularly among almanac makers, to denote the days in the year by the first seven letters of the alphabet; the same letter answering to the same day of the week in any year, and the first letter of the alphabet to the first day of the year. One of these letters must, therefore, denote all the Sundays throughout the year; and is hence called the Dominical Letter.\* If Sunday is the first day of the year, A is the dominical letter; if the year begins on Saturday, B is the dominical letter, &c.

In this table, even hundreds of years are contained at the top, and the intermediate years in the four first columns; under the one, and opposite to the other, is the dominical letter or letters for the proposed year. If there are two letters, the first answers from the beginning of the year to about the end of February, and the other serves for the remaining part of the year Every leap year has two dominical letters. By means of this and the following table, the day of the week answering to any given day of the month may be found; and conversely, if the day of the month be known within a few days. Also, the year, if known within certain limits, may be found from the day of the week and day of the month being given.

#### TABLE XVI.

# To find the Day of the Week answering to any given Day of the Month, &c.

The first vertical column contains the several months in the year, and that part of the other columns immediately opposite, contains the dominical letters: the under part contains the days of the month on which the Sundays happen; and hence, the other days of the week are easily found.

<sup>\*</sup> The dominical letters were introduced into the kalendar by the primitive Christians.

## PROBLEM I.

Given the year, month, and day of the month, to find the corresponding day of the week.

#### Rule.

Find the dominical letter answering to the given year in table XV; then find this dominical letter in table XVI, on the same horizontal line with the given month, and under it are the several days of the month upon which the Sundays happen; and hence the day of the week is known.

## EXAMPLE.

Upon what day of the week did the 18th of March, 1793,

happen?

By table XV, the dominical letter is F: now find F on the same horizontal line with March, under which are 3. 10. 17. 24. 31, the several Sundays in that month: hence, since the 17th day of the month is Sunday, the 18th is Monday.

#### PROBLEM II.

Given the year, month, the day of the week, and day of the month nearly, to find the exact day of that month.

## RULE.

Find the dominical letter for the given year by table XV, and the several Sundays in the month by table XVI; and, hence, the day of the month will be known.

#### EXAMPLE.

Whether was Thursday the 11th or 12th of March, 1795? The dominical letter for 1795 is D; under which, in table XVI, on the line with March are 1. 8. 15. 22. 29, the Sundays in that month; hence, since the 8th day of the month is Sunday, Thursday will be the 12th.

#### PROBLEM III.

Given the month, the day of the month, and the day of the week, and the year nearly; to find the corresponding year.

#### Pmr

In table XVI, find the dominical letter answering to the given day of the week and day of the month; then find this letter near the proposed limits, and the required year will be found.

#### EXAMPLE.

A person was born on Wednesday the 17th of October, but is uncertain whether the year was 1758 or 1759, required the exact year.

As the 17th of October happened upon Wednesday, the preceding Sunday was the 14th. Now, above the 14th day of the month, and oppossite to October is G. Then, in table XV, opposite to G is 1759, the year required.

## TABLE XVII.

# Refraction in Altitude.

A ray of light, from a heavenly body, in its passage through the atmosphere, describes a curve, which is convex towards that part of the heavens to which a tangent to the curve, at the extremity of it which meets the earth, would be directed. Hence, an object appears higher than it really is, and this apparent encrease of altitude is called the refraction.

The refraction is necessary for correcting altitudes of, and distances between the heavenly bodies, whether observed at sea or land. It is always to be subtracted from the observed altitude, or added to the zenith distance. This table is adapted to a mean state of the atmosphere in Britain, namely, to 29.6 inches of the barometer, and to 50° of Fahrenheit's thermometer. If the height of the mercury in these instruments be different from the mean, and if great precision is required, a correction is necessary to reduce the tabular to the true refraction. See the Author's Treatise on the Longitude, vol. i. page 82, and vol. ii. table VIII.

## TABLE XVIII.

# Parallax of the Sun in Altitude.

The difference between the places of the sun, as seen from the surface and from the centre of the earth at the same instant, is called the parallax of the sun in altitude.

This table contains the sun's parallax in altitude to every third degree. The parallax is always to be added to the apparent altitude, in order to obtain the true altitude. In observations of the sun taken at sea for the latitude, the parallax may be neglected; but for the longitude it must be taken into account.

## TABLE XIX.

# Correction of the Sun in Altitude.

The numbers in this table are the differences between the refraction and sun's parallax: these numbers are expressed in minutes and tenths of a minute, which is sufficiently accurate in computations for the latitude or apparent time. The correction is to be subtracted from the apparent altitude of the sun, in order to obtain the true altitude.

## TABLES XX. AND XXI.

# Dip of the Horizon.

The dip of the horizon is a vertical angle contained between a borizontal plane passing through the eye of an observer, and a line from his eye to the visible horizon.

The first of these tables contains the dip answering to a free or unobstructed horizon, and the numbers therein, as well as in the other table, corresponding to the height of the eye, are to be subtracted from the observed altitude when the fore-observation is used; but added thereto in the back observation. The dip in this table is expressed in minutes and tenths of a minute.

If the land intervenes, or a fog obscures the horizon, and the ship nearer to it than to the visible horizon when unconfined; and if the sun's limb is brought in contact with the line of separation of the sea and land, the dip will be considerably greater, and will encrease as the distance of the ship from the land diminishes. In this case, therefore, the distance of the ship from the land is to be found, and the dip answering thereto, and to the height of the eye, above the water, is to be taken from table XXI. Or the dip may be found independent of this table, by the rule given in the Author's Treatise on the Longitude, vol. i. page 290.

#### TABLE XXIL

# Semi-diameter of the Sun.

This table contains the angle subtended by the sun's semi-diameter at the earth, for every sixth day of the year. The months and days are contained in the first column, and the semi-diameter of the sun, expressed in minutes and tenths of a minute in the second column. This table being intended only for correcting the sun's altitude for the latitude, or finding the apparent time, it is, therefore, given in the same terms as the three preceding tables.

#### TABLE XXIII.

# - Augmentation of the Moon's Semi-diameter,

The apparent magnitude of an object encreases as the distance from the observer diminishes: and, since the moon is nearer the observer when in the zenith, than when in the horizon, by the earth's semi-diameter: therefore, the moon's semi-diameter encreases with its altitude; and this encrease is called the augmentation of the moon's semi-diameter. This table contains the augmentation to every third degree of altitude.

# TABLE XXIV.

# Declination of the Sun.

This table contains the sun's declination for the noon of each day, under the meridian of Greenwich, for four successive years. The declination is expressed in degrees and minutes.

## TABLE XXV.

# Reduction of the Sun's Declination to a future Period.

It has been customary to title a table of the sun's declination, so as to have the appearance of answering for several years, which is evidently fallacious. The present table is intended to reduce that of the sun's declination to a subsequent period. In the side column of the table are periods of 4, 8, &c. years to 20; and the months and each sixth day are at the top, opposite to the one, and under the other is the corresponding change of declination, which is to be added or subtracted, according as the sign above is + or—. If the time for which the sun's declination is required, be previous to the 28th February, 1800, the declination answering to the day following that given is to be taken.

## Examples.

I.

# Required the sun's declination 1st April, 1817? The given year is 12 years after 1805.

| Now, Sun's declination 1st April, 1805 | • | ٦ | 4º 29' N |
|--|---|---|----------|
| Equation to 12 years, table XXV.       | 7 | - | + 2      |
| Sun's declination 1st April, 1817      | ₹ | = | 4 31 N   |

#### II.

What is the sun's declination 17th October, at noon, anno 1826? The given year is 20 years after the year 1806.

| Now, Sun's declination 17th October 1806 | • | - | 9° 7′ S |
|--|---|---|---------|
| Equation to 20 years, table XXV,         | ٠ | - | + 3     |
| Sun's declination 17th October, 1826     | - | • | 9 10 S  |

The correction of declination may be found independant of the table, as follows:—

From the given year subtract as many times 4, as will reduce it to one of the years to which the table is adapted, and take out the declination answering to the given time as before; find also the declination answering to the following day, and multiply the difference between them by one-fourth of the difference between the given and tabular years, and the product divided by 33, will give the correction; which is additive when the declination is encreas-

ing, and subtractive when decreasing. If the given time is prior to that in the tables, the correction is to be applied in a contrary manner.

#### EXAMPLE.

Required the sun's declination, 12th March, 1827?

The given year is 24 years after 1803. Now the sun's declination 12th March, 1803, is 3° 34', and on the following day 3° 11', the difference is 23'. Then, 23' multiplied by 6, the number of fours in 24, gives 138, which, divided by 33, the quotient is 4, the correction; which, subtracted from 3° 34', because the declination is decreasing, gives 3° 30', the sun's declination 12th March, 1827.

## TABLE XXVI.

Reduction of the Sun's Declination to a different Meridian.

This table is intended to reduce the sun's declination, as given in the preceding table, to any other meridian than that of Greenwich, to which it is adapted, and to any given time of the day under that meridian. The arguments of this table are the ship's longitude, the time from noon, and the month and day of the month; the first of these is at the top of the table, the second at the bottom, and the month and day in the marginal columns. The titles at the top and bottom of these columns direct when the reduction is to be added or subtracted.

#### TABLE XXVII.

Right Ascensions and Declinations of the principal Fixed Stars.

This table contains the right ascensions and declinations of 61 principal fixed stars, adapted to the beginning of the year 1805. The fourth and sixth columns contain the annual variation in right ascension and declination, arising from the procession of the equinoxes, and combined with the proper motions of the stars: these serve to reduce the place of a star to a period, a few years after or before the epoch of the table, with tolerable accuracy. When the place of a star is wanted after the beginning of 1800, the variation in right ascension is additive, and that in declination is to be applied according to its sign. The contrary rule is to be used when the given time is before 1805.

The stars marked with an asterisk, are those used in the Nautical Almanack, for the purpose of determining the longitude by lunar observations.

#### TABLE XXVIII.

# The Right Ascension of the Sun.

This table is adapted to leap year, particularly the year 1804. In order to adapt this table to common years, one minute is to be

subtracted from the right ascension in the table, the first after leap year, two minutes the second after leap year, and three minutes the third year after leap year. And in the months of January and February, the right ascension is to be taken for the day following

that given.

This table is chiefly employed in nautical purposes, to find the time of transit of a fixed star; which is necessary to be known when the latitude is wanted from an observation of the meridian altitude of the star. And hence, also, the time of rising and setting of a star may be found; half the time of its continuance above the horizon being given.

#### PROBLEM I.

To find the apparent time of transit of a known fixed star.

#### RULE.

From the right ascension of the star, encreased by 24 hours, if necessary, subtract that of the sun, the remainder will be the approximated time of the transit of the star over the meridian of Greenwich: to this time apply the longitude, in time, of the given place, by addition or subtraction, according as it is west or east, which call the reduced time. Now, if the reduced time is less than three hours, the approximated time is the apparent time of transit of the star over the meridian of the place of observation. If the reduced time is between three and nine hours, one minute is to be subtracted from the approximate time: if between nine and fifteen hours, two minutes; if between fifteen and twenty-one hours, three minutes; and if above twenty-one hours, four minutes are to be subtracted from the approximate time, in order to obtain the apparent time of transit.

## Example.

Required the apparent time of transit of Rigel, 21st December, 1804, in longitude 45° W?

| Right ascension Rigel -<br>Sun's right ascension - | 5 <sup>h</sup> 5'<br>17 58 |          |                      |
|--|----------------------------|----------|----------------------|
| Approximate time of transit<br>Longitude in time   | 11 7                       | • • •    | - 11 <sup>h</sup> 7' |
| Reduced time                                       | 14 7,                      | Subtract | 2                    |
| Annarent time of transit                           |                            |          | 11.5                 |

## PROBLEM II.

To find the apparent time of the rising and setting of a known star, the latitude and day of the month being given.

#### RULE.

Find the apparent time of the transit of the star by the preceding problem; then, find half the time of the continuance of the star above the horizon, by table XLIV; which, being applied to the time of transit, by subtraction and addition, will give nearly the apparent times of the rising and setting of the star respectively.

Those who wish more exactness, are referred to the Author's Treatise on the Longitude, vol. ii.

#### EXAMPLE.

Required the apparent time of the rising and setting of Arcturus at London, 1st June, 1805?

| Right ascension, Arcturus                             |       | -             | •        | •              | •      | 14h | 7 <sup>4</sup><br>3 <i>5</i> |
|---|-------|---------------|----------|----------------|--------|-----|------------------------------|
| Right ascension of Sun                                | -     | -             | •        | ■.             | •      |     |                              |
| Approximate time of tran                              | sit   | -             | -        |                | •      | 9   | 32                           |
| Subtract -  | -     | -             | •        | -              | -      |     | 2                            |
| Apparent time of transit<br>To latitude 51° 31'N, and | deck  | <br>in. 200 l | S/ N. tl | <br>he half co | nt. of | 9   | 30                           |
| star above the herizon,                               | is    | •             | -        | -              | -      | 7   | <i>5</i> 0                   |
| Time, nearly, of rising                               |       |               |          |                | -      | 1   | 40                           |
| of setting  | -     |               |          |                | -      | 17  | 20, or                       |
| 5h 20', in the m                                      | ornin | g of the      | 2d of J  | une.           |        |     |                              |

#### TABLE XXIX:

# The Equation of Time.

This table contains the equation of time for leap-year, and is particularly adapted to the year 1804. By this table, however, the equation of time may be found for other years, as follows:—For the first year after leap-year, take one-fourth of the difference between the equations for the given and preceding days, which is to be added to the equation for the given day, if at that time the equation is decreasing, but subtracted therefrom if it is encreasing. In the second after leap-year, take half the difference between the equations; and in the third take three-fourths of the difference, and apply this correction in the same manner as before.

Time, as deduced from observations of the sun, is called apparent time, to which, the equation of time being applied according to its title in the table, gives mean time. And, since a watch, or time-keeper, is constructed upon the assumption of an uniform or equable motion, it is hence obvious this table is particularly useful in ascertaining the rate of a watch on mean solar time. Also, if a watch be regulated to mean time, then, the instant when the sun's meridian altitude ought to be observed, in order to find the latitude, is known by applying the equation of time to twelve hours, with a contrary title to that in the table.

## TABLE XXX.

To reduce the Time of the Passage of the Moon over the Meridian of Greenwich to the Time of its Passage over any other given Meridian.

This table is useful in finding the latitude from the meridional altitude of the moon, and in computing the apparent time, from the altitude of the moon, when observed off the meridian. The arguments of this table are, the daily retardation of the moon in passing the meridian, at the top, the time from the moon's southing in the left-hand marginal column; and the longitude of the place in the right-hand column. The corresponding equations are to be added, if the given time is after that of the moon's passage over the meridian, or if the longitude is west; but, if the time is before that of the moon's passage, or if the longitude is east, these equations are to be subtracted.

## TABLE XXXI.

Error of Observation, arising from an Inclination of the Axis of the Telescope, or Line of Sight, to the Plane of the Sextant.

If the line of sight is not parallel to the plane of the instrument, the observed angle will be greater than the truth; and this excess will encrease with that inclination, and with the angle observed: This table contains the error of observation arising from the above cause within probable limits, which error is always to be subtracted from the observed altitude of an object, or from the observed distance between two objects.

#### TABLE XXXII.

# Correction of the Moon in Altitude.

As this table is intended to be used in correcting the observed meridian altitude of the moon, in order to find the latitude, the numbers in it are, therefore, given only to the nearest minute, which is sufficiently exact for the above purpose. This correction is always to be added to the observed altitude to obtain the time.

#### TABLE XXXIII.

# Acceleration of the Fixed Stars.

The time of transit of a fixed star advances each day 3' 55".9, on mean solar time. Hence, in an observatory, the rate of a watch or clock may be accurately determined, by observing the transits of the fixed stars. Or, this may be done tolerably exact, by observing the instant of the disappearance of a star, during several successive nights, behind a fixed object, nearly in the meridian, the

position of the eye of the observer being also fixed. For this purpose, therefore, the first part of this table contains the acceleration of the fixed stars for 30 days. The second part of the table is useful for converting sidereal into mean solar time; or the converse, with sufficient accuracy for most nautical purposes.

#### TABLE XXXIV.

## Natural Sines.

This table is inserted here purposely for finding the latitude by double altitudes of the sun. The manner of taking out the natural sine answering to any given degree and minute, and conversely, is obvious. This table may be successfully applied in the solution of many problems, a few of which are the following.

#### PROBLEM I.

Given the course and distance run, to find the difference of latitude and departure.

## RULE.

Multiply the natural sine, and natural co-sine of the course, by the distance; the products, pointing off five figures to the right hand, will be the departure and difference of latitude respectively.

#### EXAMPLE.

A ship sailed S.SW. 150 miles, required the difference of latitude and departure?

| Nat. sine of |   |     |   |   |      | <b>82</b> 68, | Natur   | al co-sine | ٠ | - | .92988  |
|--------------|---|-----|---|---|------|---------------|---------|------------|---|---|---------|
| Distance     | • | • • | - | - | •    | 150           | -       | •          | - |   |         |
| Departure    | • |     | - |   | 57.4 | 0200,         | Diff. o | f latitude |   | - | 8.58200 |

#### PROBLEM II.

To find the product of two given numbers by the table of Natural Sines.

#### RULE.

Annex as many cyphers to the greater of the two given numbers as will make it consist of five places of figures; and to the less annex the same number of cyphers. Now, these numbers being considered as natural sines, find the degrees and minutes answering to each. Then, half the difference, or half the sum of the natural co-sines of the sum and difference of these arches, according as the sum is less or greater than a quadrant, will be the product required.

#### EXAMPLE.

# Required the product of 272 by 86?

|                   | . sine             | : | 150      | 47!<br>56 |                    |            | - |                |
|-------------------|--------------------|---|----------|-----------|--------------------|------------|---|----------------|

## PROBLEM III.

Given the latitude of a place, the altitude and declination of the sun, to find the apparent time of observation.

#### RILLE.

If the latitude and declination are of different names, let their sum be taken, otherwise their difference: then, from the natural co-sine of this sum or difference, subtract the natural sine of the corrected altitude of the sun, and find the log. of the remainder; to which add the log. secants of the latitude and declination: the sum of these being found in table XXXVII, will be the time from noon when the sun's altitude was observed; and hence the apparent time is known.

## EXAMPLE.

The 11th January, 1799, in latitude 57° 7'N, at 11h. 2' 43" A. M. per watch, the true altitude of the sun's centre was 10° 10', and declination 21° 46'S. Required the apparent time, and error of the watch?

| Latitude<br>Declination | -    |           | 7/<br>46     |   |             | -    |     | Ļ                 |     | ecant<br>secant | -    |   | <b>0.26526</b><br>0.03212 |

## PROBLEM IV.

Given the latitude, the apparent time, and sun's declination, to find the true altitude of the sun.

#### RULE.

Take the logarithm answering to the sun's distance from the meridian, from table XXXVII, to which add the log. co-sines of

the latitude and declination; their sum, rejecting 20 from the index, is the log. of a natural number, which, subtracted from the natural co-sine of the difference between the latitude and declination, if of the same name, or from the natural co-sine of their sum, if of different names, will give the natural sine of the true altitude of the sun's center.

The refraction being added to, and the parallax subtracted from the true altitude, will give the apparent altitude of the sun's center.

#### Example.

Required the true and apparent altitudes of the sun at Newcastle, 17th October, 1802, at 8 h. 44' 20". A. M.

| Apparent time -                                      | 8h 44/ 20/                              | •            |                              |                                   |

| Apparent alt. sun's center                           | 14 9 2                                  |              |                              |                                   |

# TABLES XXXV, XXXVI, XXXVII.

# Half Elapsed Time, Middle Time, and Rising.

The tables are employed in the computation of the latitude of a ship at sea, the latitude by account, two observed altitudes of the sun, the interval of time between them, and the sun's declination being given: they may also be applied in the solution of various other problems, as in the computation of the apparent time, the true azimuth of an object, the altitude and longitude of the nonagesimal, &c.

Table XXXV contains the log. co-secant of half the interval between the observations, and is hence called a table of HALF ELAPSED TIME. Table XXXVI. is named a table of MIDDLE TIME, and contains the log. sines of the corresponding arches, each diminished by 4.69897, the log. of half the radius. And table XXXVII. intituled a table of RISING, contains the log. versed sine of the corresponding arch, its index being diminished by 5. These tables are adapted to each tenth second of time, as far as six hours. And the rules for the several computations, which may be performed by them, may be so contrived, that any farther extension becomes unnecessary.

# TABLES XXXVIII, XXXIX, XL.

# To find the Correction of the Computed Latitude.

These tables are intended to find the correction of the latitude computed by double altitudes, in that case where more operations than one become necessary. The two first tables were drawn up by Mr. Brinkley; Professor of Astronomy, Dublin; and, together with their investigation, have been given in the Nautical Almanack for several successive years. The form of these tables is altered a little from the original, with a view to render them more easy to those seamen who are not well acquainted with decimal fractions.

#### TABLE XLI.

# Proportional Logarithms.

This table was first constructed for the express purpose of facilitating the method of finding the apparent time at Greenwich, answering to a given central distance between the moon and the sun, or a fixed star, by the assistance of the Nautical Almanack, for which purpose it is excellently adapted. It is extended to three hours, upon account of the distance being given in the Ephemeris to every three hours apparent time. As degrees and hours are similarly divided, it therefore equally answers for degrees.

This table is very useful in many calculations, especially those where sexagesimals are concerned.

#### TABLE XLII.

For computing the final Effect of Parallax on the Distance between the Moon and the Sun, or a Fixed Star.

This table, as its title implies, is used in finding the last correction of the computed distance between the moon and the sun, or a fixed star. See Navigation. It may also be applied to several fluxionary calculations.

#### TABLE XLIII.

# Amplitudes of a Celestial Body, reckoned from the Meridian.

The usual method of reckoning the amplitude is from the east or west points; however, as the azimuth is reckoned from the meridian, and as the amplitude may be called the *horizontal* azimuth; it is, therefore, evidently more proper, to reckon both either from the meridian, or from the east or west points. In this table the amplitude is reckoned from the meridian; and, therefore,

if the declination is north, the amplitude is to be reckoned from north; but if the declination is south, the amplitude is to be reckoned from the south, towards the east or west, according as the object is rising or setting. This table is extended to 231 degrees of declination, being the greatest declination of the sun, and to each degree of latitude as far as 60 degrees.

Upon account of the horizontal refraction, and the height of the eye above the water, the sun or a star, when in the true horizon, appears above it by a quantity equal to the sum of the horizontal refraction, and the dip of the horizon answering to the height of the observer above the water. If, therefore, the amplitude of the sun be observed when the center of that object is apparently in the horizon, a correction becomes necessary, which

may be found by the following rule.

To the log. tangent of the latitude, add the log. co-secant of the true amplitude, reckoned from the meridian, and the log. of the sum of the horizontal refraction and dip of the horizon, the sum, deducting 20 from the index, will be the log. of the correction of amplitude of the sun or a fixed star. When the latitude and declination of the object are of the same name, the correction is to be added to the observed amplitude, in order to obtain the corrected amplitude; but when of a contrary name, it is to be subtracted therefrom. Or the correction being applied to the true amplitude, as found in the table, or by calculation, by addition or subtraction, according as the latitude and declination are of a contrary or of the same denomination, will give the apparent amplitude.

If the observed object is the moon, then the sum of the horizontal refraction and dip is to be subtracted from the moon's horizontal parallax, and the remainder is to be used in the preceding rule: and the correction thus found is to be applied in a contrary manner to the former.

#### EXAMPLES.

Required the apparent amplitude of the sun at rising, answering to latitude 55° o' N, sun's declination 12° o' N, and height of the eve 10 feet ?

To latitude 55° o', and declination 12° o' N, the true amplitude is N 68° 46' E.

| Horizontal refraction Dip to 10 feet - | - ·93′<br>- <b>3</b>           | ,                           |   |   |
|--|--------------------------------|-----------------------------|---|---|

| Correction                             | - 65                           | log                         | - | 1.74160   |
| Apparent amplitude                     | - N 67 51 E.                   |                             |   |   |

#### II.

Required the apparent amplitude of the moon at setting, in latitude 48° N, the moon's declination being 20° S, horizontal parallax 58', and height of the eye 18 feet?

With the given latitude and declination, the true amplitude found in the table is S 59° 15' W.

| Horizontal refraction   | - \$3'       |           | •                           |
|-------------------------|--------------|-----------|-----------------------------|
| Dip to 18 feet -        | - 4          |           |                             |

| Moon's horizontal paral | lax 58       |           |                             |
|                         |              |           |                             |
| Difference              | - 21         | log       | <ul> <li>1.32222</li> </ul> |
| Latitude                | - 48 0       | tangent - | - 0.04556                   |
| True amplitude -        | - \$5915 W.  | co-secant | - 0.06580                   |
| •                       |              |           |                             |
| Correction -            | - 27         | log       | <b>- 1.49</b> 35 <b>8</b>   |
|                         | <del></del>  |           |                             |
| Apparent amplitude      | - \$58 48 W. |           |                             |

When the latitude and declination are expressed in degrees and parts of a degree, it will, when accuracy is wanted, be more expeditious to find the true amplitude by the common rule than by the table, thus:—the log. co-sine of the true amplitude is equal to the sum of the log. secant of the latitude, and the log. sine of the declination, rejecting 10 from the index.

## TABLE XLIV.

Half the Time of Continuance of an Object above the Herizon, the Latitude and Declination being of the same Name; or half the Time of Continuance under the Horizon, the Latitude and Declination being of a contrary Name.

This table contains the time of the semi-duration of an object above the horizon, when its declination is of the same name with the latitude of the place of observation; or the time of half its continuance under the horizon, when the latitude and declination are of a contrary denomination. Hence, if the object whose rising or setting is required, is the sun, this table gives the time of setting of that object, when the latitude and declination are of the same name, and the time of rising when of contrary names.\* But, in

<sup>\*</sup> The time of the rising and setting of the sun may be found independent of the table, by the following rule. To the tangent of the latitude, add the tangent of the declination; the sum, rejecting radius, will be the log. co-sine of an arch, which reduced to time, will be the time of the rising, the latitude and declination being of the same name, or the time of setting is of different names.

order to obtain the time of rising and setting of a fixed star or planet, the time of its culminating or passing the meridian must be first found. The method of finding the time of transit of a fixed star is shown in the explanation of table XXVI, and that of a planet may be found by the Nautical Almanack, page iv of the month. Now, to the time of transit of the given object, its semi-diurnal arch answering to its declination, and to the latitude of the place of observation, being applied by subtraction and addition, will give the time of rising and setting of the object.

The time of rising and setting, as found by this table, requires a correction, depending on the latitude and declination, and on the aggregate of the horizontal refraction, dip of the horizon, and horizontal parallax, which may be found as follows.

# 1. The object being the sun,\* or a fixed star.

Find the sum and difference of the natural co-sine of the declination, and natural sine of the latitude, and take half the sum of the logarithms of these quantities; to which add the constant log. 1.1761, and the prop. log. of the sum of the horizontal refraction and dip of the horizon, the sum, rejecting 10 from the index, will be the prop. log. of the correction, which is to be added to the time of rising, and subtracted from that of setting, as found by the table, in order to obtain the time of the apparent rising and setting of the object.

# 2. If the object be the moon.

The difference between the moon's horizontal parallax, and the sum of the horizontal refraction and dip, is to be used in the preceding rule, in place of the last quantity: and the correction thus found is to be applied in a contrary manner to that for the sun or a fixed star; the moon's horizontal parallax being the greater quantity.

#### TABLE XLV.

# Apparent Time of Transit of Pole Star.

This table is adapted to leap year, particularly 1804. In order to make it serve for other years, the time of transit must be taken for the day following that given in the months of January and February. For the first year after leap year, one minute is to be added to the time of transit given in the table; two minutes for the second, and three minutes for the third after leap year.

<sup>.</sup> The sun's parallax is here neglected, as its effect in this case is almost insensible.

Again, to reduce this table to a different meridian than that to which it is adapted, viz. Greenwich; if the longitude is between 45° E, and 45° W, there is no correction to be applied. If the longitude is between 45° and 135° E, one minute is to be added; but if it is between 45° and 135° W, one minute is to be subtracted. If the longitude is between 135° E, and 180°, two minutes are to be added, but subtracted if the given longitude is between 135° W, and 180°.

This table is useful to find the time when the altitude of the pole star ought to be observed, to find the latitude by its meridian altitude; it is also useful in finding the variation of the compass

by the pole star.

# TABLE XLVI.

Difference of Altitude of the Pole Star and the Pole, at different distances of the Star from the Meridian.

As the pole star is generally known, that no opportunity, therefore, may be lost for determining the latitude, this table is inserted, the use of which is as follows:—

Find the interval between the time of observation of the altitude of the pole star, and that of its passing the meridian,\* and take out the corresponding equation from the table; which added to, or subtracted from the true altitude of the pole star, will give the latitude of the place of observation.

#### EXAMPLES.

I.

Let the corrected altitude of the pole star be 46° to' N, observed 8h. 30' before its passage over the meridian. Required the latitude?

| True altitue | de of th | e pole s | tar | - `    | - | - | 46° | 10/1 | N. |
|--------------|----------|----------|-----|--------|---|---|-----|------|----|
| Equation fi  |          |          |     | h. 30' |   | - | + 1 | 5    |    |
| Latitude     | -        | -        |     |        | , | _ | 47  | 15 1 | ٧. |

II.

At 1 h. 10' after the passage of the pole star over the meridian, its altitude corrected was 58° 51'N. Required the latitude?

| True altitude-o | f the<br>table | pole stat<br>XLVI. | to 1 h. | 10' | - | - | <br>580<br>1 | 51′Ņ.<br>42 |
|-----------------|----------------|--------------------|---------|-----|---|---|--------------|-------------|
| Latitude        |                | -                  | :       | -   |   | - | 57           | 9 N.        |

<sup>\*</sup> If this interval is expressed in mean solar time, it ought to be reduced to sidereal time. This may be done with sufficient accuracy for most purposes, by adding the proportional part from table XXXIII, part 2d.

## TABLE XLVII.

# To find the Distance of Objects at Sea.

In this table, no allowance is made for terrestrial refraction, upon account of its uncertainty, as it varies, according to General Roy, from one-third to one-twenty-fourth part of the intercepted arch. Hence, the distance given by this table, will always be less than the apparent distance between the objects.

The distance between any two objects whose heights are given, is found by adding the distances answering to the given heights.

## EXAMPLES.

#### T.

At a place 104 feet above the level of the sea, with a telescope, a small portion of the main-top-gallant sail of a ship, which had sailed the day before, was observed apparently above the horizon. Now, the height of that part of the sail, which appeared in the horizon, above the sea, is 165 feet, the distance of the ship is required?

|             |     |      | the distance |   |   | - | 10.84<br>13.66 |
|-------------|-----|------|--------------|---|---|---|----------------|
| Distance of | the | ship | -            | ÷ | - | - | 24.50 miles.   |

## II.

The upper part of a light-house, whose height above the sea is 68 feet, was observed in the horizon, the height of the eye being 14 feet. Required the distance of the light-house?

| To height 68 feet, the distant<br>14 feet, the distant | ce is<br>ce is | • * * | • | 8 77<br>3.98 |
|--|----------------|-------|---|--------------|
|  |                |       |   |              |
| Distance of the light-house                            | -              | -     | - | 12.75 miles. |

#### REMARKS.

#### I.

If the given height exceeds the limits of the table, find the distance answering to one-fourth, one-ninth, one-sixteenth, &c. of the given height; which being multiplied by 2, 3, 4, &c. accordingly, will give the required distance.

#### EXAMPLE.

Let the height of a mountain be 9400 feet; required the distance when its top will be just visible, the eye being supposed to be in the horizon? One-fourth of 9400 feet is 2350, opposite to which in the table is 51.55 miles, which multiplied by 2 is 103.1 miles, the distance.

#### IT.

If the ratio of the horizontal refraction to the distance be given, the apparent distance will be obtained by increasing the distance found by the table accordingly.

# EXAMPLE.

The peak of Teneriff was observed in the horizon by a person. 150 feet above the surface of the sea; required the distance, the height of the peak being assumed to be 13280, and the terrestrial refraction one-tenth of the intercepted arch?

| As the given h<br>sixteenth of it be<br>Which multipl | taken, wh   | ich is 830      | , opp | osite to |   |     |   | )E-<br>-<br>- | 30.26           |
|---|-------------|-----------------|-------|----------|---|-----|---|---------------|-----------------|

| Distance uncor  | rected by   | refraction<br>- |       |          |   |     |   |               | 134.07<br>13.41 |
| Distance corre  | cted by ref | raction         | -     | -        | - | -   | • | •             | 147.48          |

#### III.

The distance given in this table is expressed in nautical miles, of which 60 are contained in one degree: and there are 60.1 English miles in the same portion of the meridian. If, therefore, the distance is required in English miles, to the constant logarithm 0.06133 add the logarithm of the given distance in nautical miles, and the sum will be the logarithm of the distance in English miles.

#### Example. .

Let the distance expressed in nautical miles be 147½. Required the distance in English miles?

| Constant logarithm Distance in nautical miles |   | 147.5 |   | log. | 0.06133<br>2.16879 |
|---|---|-------|---|------|--------------------|
| Distance in English miles                     | • | 169.9 | - | •    | 2.23012            |

## IV.

The distance being given, the height is easily found; being the converse of the preceding operation.

## TABLE XLVIII.

To convert Degrees, &c. into Time, and conversely.

In column first of this table, are contained degrees and minutes, and in the second column the corresponding hours and minutes, or minutes and seconds: the other columns, titled D, are a continuation of the first; and those titled H, M, a continuation of the second. The manner of using this table will be obvious from the following examples.

# EXAMPLES.

T.

# Reduce 69° 23' to time?

| Opposite to to | 69 <sup>0</sup><br>23′ | in column 3d is<br>in column 1st is | • - | 4 <sup>h</sup> 36'<br>1 32" |
|----------------|------------------------|-------------------------------------|-----|-----------------------------|
| Hence          | 69 23                  | =                                   |     | 4 37 32                     |

II.

# Convert 5 h. 46' 24" to dégrees?

| Opposite to to |               | in column 4th is<br>in column 2d is |       | in col. 2d<br>in col. 1st |
|----------------|---------------|-------------------------------------|-------|---------------------------|
| -              | <del></del> , |                                     |       |                           |
| Hence -        | 5 46 24       | -                                   | 86 36 |                           |

# TABLES XLIX. AND L.\*

To find the Meridian Altitude of an Object, and hence the Latitude, from the Altitude observed a few Minutes before or ofter the Time of Transit of the Object.

In consequence of the interposition of clouds, it frequently happens that the sun, or other celestial objects, are observed when on the meridian. If, however, the altitude has been observed a few minutes before or after the time of the object's transit, the meridian altitude, and consequently the latitude of the place of observation, may be found by means of these tables, by the following

<sup>\*</sup> See Longitude, vol. ii. p. 254. Coleccion de Tablas, por Don Joseph de Mendoza y Rios. Madrid 1800. p. 87, &c.

## RULE.

Find the number in table XLIX, answering to the latitude by account, and the declination of the object, which, if the sun, is to be reduced to the meridian of the given place. Multiply this number by that from table L, answering to the given interval between the time of observation and noon, the product will be the difference between the observed and meridian altitudes, in seconds; which, reduced to minutes, and added to the observed altitude, the sum will be the meridian altitude; and hence, the latitude is found by the common rule.

## ' REMARK.

The interval between the time of observation and noon, may be found by equal altitudes, by a time-keeper, &c.

#### EXAMPLES.

## I.

April 22d, 1805, in latitude about 20° N, and longitude by account 65° E, the observed altitude of the sun's lower limb, 9' 51", after its passage over the meridian, was 81° 36' S, and height of the eye 30 feet: required the latitude?

## TABLE LI.

To reduce the Longitude, Latitude, Right Ascension, Declination, Semidiameter, and Horizontal Parallax of the Moon, as given in the Nautical Almanack, to any given Meridian, and to any given Time under that Meridian.

This table might have been greatly contracted:—to prevent, however, any ambiguity to those not much acquainted with the method of taking out proportional parts, it is given in its present extended form. The proportional part answering to any given variation in twelve hours, is found by adding the parts answering to the several quantities that make up the whole difference in that period; which sum is to be added to the longitude, or right ascension of the moon at the preceding noon or midnight, rejecting 360° if either exceeds that quantity. And it is to be applied by addition or subtraction, to the latitude, declination, semi-diameter, and horizontal parallax of the moon, according as these quantities are increasing or decreasing.

## EXAMPLES

#### I.

Required the moon's longitude, the 16th February, 1806, at 7 h. 36' P. M.?

| Moon's longitude, 16th February, 186, at noon at midnight |               |           |         |      |      |      |    |   | 10s. 4° 0′ 10″<br>10 9 56 16 |    |    |    |

#### REMARKS.

#### I.

It is evident these operations may be much contracted, by taking out two or more of the proportional parts at once.

#### II.

This table will also be usful in reducing the sun's longitude, right ascension, and declination, to a given time and meridian, by finding the proportional part answering to the reduced time, and half the variation of the sun's notion in twenty-four hours.

# TABLE LII.

# Equation of Second Difference.

If the motion of the moon in tweve hours was uniform, the place of that object, as deduced by the receding table, would be correct. The motion of the moon, however, in twelve hours is almost always unequal; and, therefore, a correction becomes ne-

cessary—which correction is contained in this table, of which the arguments are, the mean of the two second differences of the moon's motion at the top, and the apparent time after noon or midnight in the side columns. This equation must be added to, or subtracted from the proportional part of the first difference of the moon's motion in twelve hours, found by the preceding table, according as that difference is decreasing or encreasing. Hence, the corrected proportional part, answering to the given interval, will be obtained.

If the given second difference is not found in the table, the sum of the equations answering to the several terms which make up the second difference, is to be taken.

#### ` Examples.

## TABLE LIII.

# Altitude to be observed, in order to ascertain the Apparent Time with the greatest Accuracy.

As the change of altitude is quickest when the object is in the prime vertical, the most proper time for observing an altitude, from which the apparent time is to be inferred, is, therefore, when the object is due east or west; other errors are, also, in this case avoided, particularly that arising from an error in the latitude by account at the time of observation. This table contains the altitude of an object, when in the above position. The declination is marked at the top, and the latitude of the place of observation in the side column.

Altitudes under 3° should not be employed in the computation of the apparent time, upon account of the uncertainty of the refraction near the horizon. During one-half of the year, or while the sun is on the other side of the equator, with respect to the observer, the sun is not due east or west while above the horizon; in that case, therefore, the observations for ascertaining the time must be taken while the sun is near the horizon; the altitude, however, not being less than 3°, for the reason assigned above.

#### EXAMPLE.

June the 1st, 1806, in latitude 50° N, by account, intending to ascertain the apparent time from observations of the sun, the altitude when that observation is to be made, that the apparent time may be inferred with the greatest accuracy, is required?

The sun's declination the 1st of June is 22°, under which, and opposite to 50°, the given latitude is 29° 17′, the required altitude.

## TABLE LIV.

# Hyperbolic Logarithms.

The logarithms in this table are of the kind first calculated by Baron Napier, and are called Hyperbolic Logarithms, upon account of their application to the determination of the quadrature of the assymptote spaces of the right-angled hyperbola. These logarithms are eminently useful in finding fluents, the sums of infinite series, &c.

The logarithm of any number in the regular progression, from 1.00 to 10.00, and from 10 to 1000, is found directly in the table; and the logarithm of any other number, not exceeding seven figures, may be found by the following rules.

#### PROBLEM I.

To find the Hyperbolic Logarithm of any given number.

#### FIRST.

If the given number is found in the table, the corresponding logarithm is that required.

## SECOND.

If the given quantity consists of a whole number, with a decimal annexed; and the integral part within the limits of the table.

## RULE.

Find the sum and difference of the given number, and the next less number in the table; then, the difference being divided by half the sum, and the quotient added to the hyperbolic logarithm of the next less number, the sum will be the hyperbolic logarithm of the given number.

#### THIRD.

If the given number exceeds 1000.

## RULE.

Let the three left-hand figures be considered integers, and the remaining figures decimals, and find the corresponding hyperbolic logarithm; to which add 2.3025851, the hyperbolic logarithm of 10, if the given number consists of 4 places of integers; 4.6051702, if it consists of 5 places; 6.9077553, if it consists of 6 places; 9.2103404, if it consists of 7 places of integers; carrying on the addition of the multiples of the hyperbolic logarithm of 10, according as the given number consists of more places of integers, and the sum will be the hyperbolic logarithm required.

# EXAMPLES.

Required the hyperbolic logarithm of 3.1415926?

The next less tabular number is 3.14, the sum of which, and the given number 3.1415926, is 6.2815926, and the half is 3.1407963; also the difference of the two first numbers is .0015926. Now, this difference being divided by half the sum; the quotient is 0.0005071, which added to 1.1442228, the hyperbolic logarithm

of the next less number 3.14, the sum 1.1447299 is the hyperbolic logarithm of the given number 3.1415926.

Required the hyperbolic logarithm of 365.24222?

| Given number -<br>Next less tab. number | <b>3</b> 65.24222<br><b>\$6</b> 5.   |      |                        |   |                    |

| Hyperbolic log. of                      | 785398                               | =    | 13.5739459                               |   |              |   |                              |

## PROBLEM II.

To find the number answering to any given Hyperbolic Logarithm.

#### RULE.

If the given logarithm is found in the table, the corresponding number is that required.

If the given logarithm is greater than 4.6051702, and less than

6.9077553.

Find the difference between the given, and the next less logarithm in the table; which being multiplied by twice the number answering to the next less logarithm, and divided by the excess of 2. above the given difference, will give the decimal to be annexed to the number answering to the next less hyperbolic logarithm to that given.

If the given hyperbolic logarithm is between 2.3025851 and 4.6051702, encrease it by 2.3025851, find the corresponding number, and remove the decimal point one place to the left. If less than 2.3025851, encrease it by 4.6051702, find the number answering thereto, and remove the decimal point two places to the left.

If the given hyperbolic logarithm is between 6.9077553 and 9.2103404, subtract 2.3025851 therefrom, find the number as before, and remove the decimal point one place to the right. If it is between 9.2103404 and 11.5129255, the log. 4.6051702 is to be

subtracted from it, and the decimal point is to be removed two places to the right, in the corresponding natural number.

The natural number answering to any given hyperbolic loga-

rithm may be found as follows:

Multiply the sum of 2. and the difference between the given and next less tabular logarithms, and divide the product by the excess of 2. above the said difference, the quotient will be the required natural number. Observing, that if the given logarithm is without the limits of the table, it is to be reduced thereto, by applying the logarithm 2.3025851, or its multiples, as before.

# Examples.

I.

Required the natural number answering to the hyperbolic logarithm 5.9005608?

| Given hyperbolic logarithm<br>Next less, which answers to | -   | <b>365.</b> | • | 5.9005608<br>5.8998974 |
|---|-----|-------------|---|------------------------|
| Difference  | - · |             |   | 0.0006694              |
| Traces of 0 shows the difference                          |     |             | _ | 1.0000000              |

Now, multiply 0.0006634 by 730, the double of 365, divide the product by 1.9993366, and the quotient .24222, annexed to 365, the sum 365.24222 is the number answering to the given hyperbolic logarithm.

| Or, | Difference<br>Constant r |          | -<br>ber | •           | 0.000<br>2.            | 6634                 |

Difference 1.9993366) 730,2421410 (365.24222. Number required, 59980098

> 39986732 42675480 39986732

2688748 (F 2)

يو ريا

## REMARK.

The above is inserted at full length, according to the common method of operation, but might have been greatly contracted. The easiest method, however, of finding the proportional part, according to the first rule, is by using common logarithms. Thus,

| Difference of given<br>Double No. 2018 were | and next l  | <b>0.0006634</b><br>730. | log.<br>log. | 6.82178<br>2.86332 |      |                    |
|---|-------------|--------------------------|--------------|--------------------|------|--------------------|
| Sum -<br>Excess of 2. above                 | the differe | nc <b>e</b>              |              | 1.9993366          | log. | 9.68510<br>0.30089 |
| Proportional part<br>Next less tabular n    | umber       | •                        |              | 0.24222<br>\$65.   |      | 9.38421            |
| Number required                             |             | •                        |              | 865.24222          |      |                    |

#### II.

Required the number answering to the hyperbolic logarithm of 13.5739459?

The given logarithm is without the limits of the table, therefore,

|  | <b>3.5739459</b><br>6.9077 <i>5</i> 58  |
|--|---|
| Remainder Next less log. which answers to 785      | 6.6661906<br>6.6656837 785 log 2.89487  |
| Difference   | 0.0005609 log 6.70492<br>2. log 0.30103 |
| Excess of 2 above the difference                   | 1.9994931 ar. co. log. 9.69908          |
| Proportional part 78 Next less tabular number - 78 | .398 9.599 <b>9</b> 0                   |
| Number 78  | 85.396                                  |

But, in order to bring the given hyperbolic logarithm within the limits of the table, it was diminished by three times the hyperbolic logarithm of 10, therefore, the decimal point must be removed three places to the right-hand; hence, the number answering to the given hyperbolic logarithm is 785398.

## TABLE LV.

To reduce Common to Hyperbolic Logarithms, and conversely.

In many operations it is necessary to reduce common to hyperbolic logarithms, and conversely; and therefore this table is inserted. The manner of using it will be obvious from the following problems.

#### PROBLEM I.

# To find the Hyperbolic Legarithm answering to a given Common Logarithm.

Divide the given common logarithm into periods of three figures each, beginning at the left, including the index, and annexing a cypher, if necessary, to the two right-hand figures, to make that period complete; then take out the hyperbolic logarithms answering to the several periods, and the sum will be the hyperbolic logarithm answering to the given common logarithm.

#### EXAMPLE.

Required the hyperbolic logarithm, answering to the common logarithm 0.4971498?

The given logarithm, divided into periods of three figures, beginning at the left-hand, with a cypher annexed to make the last period complete, will be as follows: 049.714.980. Now,

| The hyperb | olic log. of th | e First period<br>Second period | 049. is   | _  | 1.1282667 <b>0</b><br>164 <b>4045</b> |  |
|------------|-----------------|---------------------------------|-----------|----|---------------------------------------|--|
|            |                 |                                 |           | •  | - 225 <b>6</b>                        |  |
| Hyperbolic | logarithm of    | <b>-</b> , -                    | 0.4971498 | == | 1.14472971                            |  |

# PROBLEM II.

To find the Common Logarithm answering to a given Hyperbolic Logarithm.

#### RULE.

From the given hyperbolic logarithm, subtract the next less in the table, and take out the corresponding common logarithm. From the remainder subtract the next less hyperbolic logarithm, and find the corresponding number which is to be annexed to the former; and in this manner proceed, and the sum will be the corresponding common logarithm.

#### EXAMPLE.

Required the common logarithm, answering to the hyperbolic logarithm 5.90056075?

| Given hyp. log.<br>Next less hyp. log. | -       | 5.9005607 <i>5</i><br>5.89461784 | Correspon  | ding com, log. | 256 <sup>°</sup> |
|--|---------|----------------------------------|------------|----------------|------------------|
| Remainder -<br>Next less hyp. log.     |         | 594291<br>594067                 | <b>-</b> . | common log.    | 258              |
| Remainder -<br>Next less hyp. log.     | -       | 224<br>229                       |            | common log.    | . 097            |
| Common logarithm                       | equired |                                  | -          | -              | 2.56258097       |

# TABLE LVI.

# Lengths of Circular Arches.

This table is useful in finding the length of an arch of a circle, containing any number of degrees, and of a given radius, and conversely. The manner of using it will be obvious from the following examples.

EXAMPLES.

I.

Required the length of the circular arch of a bridge, containing 42° 24', the radius being 66 feet?

| Length to<br>Length to | 42° 0′<br><b>24</b> | <b>-</b> '   | 0.7330383<br>69813     |   |                    |
|------------------------|---------------------|--------------|------------------------|---|--------------------|
| Length to<br>Radius    | 420 24'             |              | 0.7400196<br>66        |   | ·                  |
|                        | ,                   |              | 4.4401176<br>44.401176 |   |                    |
| Length                 | -                   | <b>-</b> . ' | 48.8412936             | = | 84 feet 10 inches. |

TT.

Let the length of a circular arch, whose radius is 50 feet, be 46.9842650: Required the number of degrees it contains?

| The length, 46.9842650, divided by<br>Next less | <i>5</i> 0, is |                  |        | nd. arch 5 | 13°        |
|---|----------------|------------------|--------|------------|------------|
| Remainder                                       | . <b>-</b>     | 146608<br>145444 | •<br>• | -          | <i>5</i> 0 |
| Remainder                                       | -              | 1164<br>1164     | _      | -          | 94         |
| Hence, the corresponding arch is                | ,              | -                | -      | - 4        | 53 50 24   |

## III.

The span of a bridge is 80 feet, height, or versed sine of the circular arch 25 feet. Required the length, and number of degrees contained in the arch?

| The radius                   | $=\frac{40^2}{25}$ | + 25 = 6                | 4 + 25 = 89.     |   |                            |
|------------------------------|--------------------|-------------------------|------------------|---|----------------------------|
| Now, half span<br>Radius –   | -                  | 40<br>89                | - log.<br>- log. | - | 1.60206<br>1.94939         |
| Half arch -                  | , <b>- 2</b>       | 4 12                    | - tangent        | • | 9.65267                    |
| Whole arch Length of arch of | - 4                | 8 24.<br>48° 0'<br>0 24 | to radius 1.     | _ | 0,8377580<br>6981 <b>3</b> |

|                              |                    |                         |                  | ` | 7.6026537<br>67.579144     |
| Leouth of arch               | _                  | _                       | `                |   | 75.1817977                 |

# TABLE LVIL

# Reciprocals of Numbers.

This table contains the quotients of unity, divided successively by the series of natural numbers, from 1 to 1000, extended to seven places of decimals, except those which terminate within that period, as the reciprocals of 2. 5. 8. &c.

By this table, vulgar fractions are expeditiously converted into decimal fractions of the same value: it is also useful in various

other calculations.

In order to reduce a vulgar fraction to a detimal, by this table, multiply the reciprocal of the denominator of the given fraction by its numerator.

| y na :         | muinci audi.                |         |         |       |          |                |        |            |      |       |       |               |
|----------------|-----------------------------|---------|---------|-------|----------|----------------|--------|------------|------|-------|-------|---------------|

## TABLE LVIII.

# Square Roots of Numbers.

In this table the square roots of all whole numbers under root are contained: by it, however, the square roots of other numbers may be found nearly, by common proportion, or more exactly by the method of interpolation.

If the given number, whose root is wanted, consists of any number in the table with cyphers annexed, its square-root is found directly in the table, by removing the decimal point towards the right, half as many figures as there are cyphers annexed.

Thus, the square-root of 9700. is 98.488578, of 975000000 is 91224.9900.

#### TABLE LIX.

# Cube Roots of Numbers.

This table contains the cube-roots of all whole numbers under 300, and is extended to six places of decimals: its use is obvious from what has been said in the explanation of the preceding table.

## TABLE LX.

# Amount of f. 1, at Compound Interest.

This table contains the amount of  $\mathcal{L}.1$ , at the several rates of  $\mathfrak{Z}, \mathfrak{Z}, \mathfrak{$ 

EXAMPLE.

Required the amount of £.750, for 50 years, at 44 per cent.?

Amount of £.1 for 50 years, at £.4½ per cent. is - 9.03268 - 750 451.63150

6322,841

Or £. 6774 9 5<sup>2</sup>

£. 6774.47250

## TABLE LXI.

# Present Value of f. I, for Years, at Compound Interest.

The present value of f.1, from 1 to 60 years inclusive, and at various rates per cent., compound interest being allowed, is contained in this table. The present value of any given sum, payable at the expiration of any number of years less than 60, is found by multiplying the present value of f.1, for the given number of years, at the proposed rate per cent., by the given sum or principal.

#### EXAMPLE.

Required the present value of £.2500, payable 50 years hence, 5 per cent., compound interest being allowed?

Present value

£. 218.010000

## TABLE LXII.

Amount of an Annuity of f. I, for Years, at Compound Interest.

By this table, the amount of an annuity for any given time and sate, within the limits of the table, is found by the following rule.

Take out the amount of £.1, answering to the given time and.

rate of interest; which multiplied by the given annuity, the product will be the required amount.

#### EXAMPLE:

Required the amount of an annuity of £.200, in 10 years, at 5 per cent. compound interest?

| Amount of | £.1, in 1 | 0 <del>y</del> ears | , at 5 p | er cent.   | - | - | 12.57789   |
|-----------|-----------|---------------------|----------|------------|---|---|------------|
| Annuity   | -         | 1                   | -        | •          | • |   | 200        |
| Amount    | •         | -                   |          | <b>4</b> - | 4 | ÷ | 2515,57800 |

# TABLE LXIII.

Present Value of an Annuity of L.1, Compound Interest.

This table contains the present value of an annuity of £.1, for complete years as far as 60, and at various rates of interest. The use of this table in finding the present value of any given annuity for a number of years, and at a rate of interest within the limits of the table, is as follows:—

# PROBLEM I.

To find the value of an annuity for a given number of years, at a given rate of interest, the annuity commencing immediately.

#### RULE.

Multiply the tabular number, answering to the given years and rate of interest, by the given annuity, and the product will be the present value required.

#### EXAMPLE.

Required the present value of an annuity of £.20, which is to continue 50 years, rate of interest 5 per cent.?

| Under 5, and  | opposite | to 50 | ), is    | -        | - | - | 18.2559 <b>\$</b> |
|---------------|----------|-------|----------|----------|---|---|-------------------|
| Annuity       | •        | -     | •        | <b>-</b> | ÷ | • | 20                |
| Present value |          | •     | <u> </u> |          | • | - | 365.11860         |

#### PROBLEM II.

When the annuity does not commence till after a certain number of years.

#### RULE.

Multiply the difference between the tabular numbers answering to the time of commencement and end, at the proposed rate of interest, by the given annuity, the product will be the present value required.

EXAMPLE.

An annuity of £.40 per annum is to commence 20 years hence,
(G)

and is to continue 30 years: required its present value, the rate of interest being 4 per cent.?

| Under 4, and  | opposite | e to | 20, is | - | • | -   | 18.59088     | 3      |
|---------------|----------|------|--------|---|---|-----|--------------|--------|
| -             | -        |      | 50, is | - | - | -   | 21.48218     | 3      |
|               |          |      |        |   |   |     | <del></del>  | -      |
| Difference    | •        | •    | -      | - | - | -   | 7.89185      | 5      |
| Given annuity |          | -    | •      | - | - | -   | - 40         | )      |
| Present value |          | _    | _      |   |   | , _ | f. 315.67400 | -<br>o |

## TABLE LXIV.

The Annuity which f. 1 will purchase, Compound Interest being allowed.

The manner of using this table is obvious from what has been said relative to the preceding tables.

#### EXAMPLE.

A person intends to lay out £.500 in the purchase of an annuity to continue 10 years, the rate of interest being 5 per cent. Required the annuity?

| Under 5, and<br>Given princip |   | site to |              | is<br>- | - | - | - | .1     | 29504<br>500 |
|-------------------------------|---|---------|--------------|---------|---|---|---|--------|--------------|
| Annuity                       | - | •       | <del>;</del> | _       | - | - | £ | . 64.7 | 52000        |

# TABLE LXV.

# Probabilities of Life at different Places. -

This table exhibits the probabilities of life at different places, and is necessary for the calculation of annuities upon lives at these places. The number of persons born at the same time, are here reduced to the same number, viz. 1000, for the sake of more readily comparing the number of persons alive at different places, at any given age. Thus, at the age of 40 years, out of 1000 persons born at the same place at the same time, there will be 214 alive at London, and 369 alive at Edinburgh: hence Edinburgh is more favourable for human life than London.

The probability or chance, that a person of a given age shall continue in existence any proposed number of years, is easily found by this table, being expressed by a fraction, whose denominator is the number of persons alive at the present age, and numerator; the number alive at the age to which it is proposed to attain; and the chance of dying before the person reaches that period is a fraction, having the same denominator as before, and whose numerator is the difference between the numbers alive at the two ages. Thus, the probability that a person, residing in London, aged 30, shall live 20 years longer, or attain the age of 50, is  $\frac{1}{27}$ , or as 13 to 7 nearly; and the chance of his dying before he attains that age is expressed by  $\frac{1}{27}$ , or as 13 to 6 nearly.

# TABLES LXVI, LXVII, LXVIII.

For finding the Value of Annuities on Single and Joint Lives.

These tables were constructed by that ingenious mathematician, Mr. Thomas Simpson of Woolwich, upon the London bills of mortality. Their use is explained in the following problems.

#### PROBLEM I.

To find the Value of an Annuity for a given Single Life, at a proposed rate of Interest, within the limits of the Table.

#### RULE.

From table LXVI, take the number answering to the given age and proposed rate of interest, which multiplied by the given annuity, the product will be the required value.

#### EXAMPLE.

Required the value of an annuity of £.50, upon a single life, aged 40 years, according to the London bills of mortality, the rate of interest being reckoned at 4 per cent.?

| The value o | f an a | nnuity | of 1 | l. for | 40 ye | ars, at 4 per  | cent. is | -   | 11.5    |
|-------------|--------|--------|------|--------|-------|----------------|----------|-----|---------|
| Annuity     | -      |        | -    | • `    | -     | •              | -        |     | 50      |
| Value       | -      |        | _    |        | -     | · <del>-</del> | _        | 1 4 | . 575.0 |

## PROBLEM II.

To find the Value of an Annuity for Two Joint Lives.

#### RULE.

Multiply the number in table LXVII, answering to the given ages, and at the proposed rate of interest, by the given annuity, and the product will be the required value.

#### EXAMPLE.

Required the value of an annuity of £.60 for two joint lives, the one being 30, and the other 40 years, interest 4 per cent.?

| The number    | answering    | to 90 a      | and 40 year | s, and 4 p | er çent. is | - | 8.8<br>60    |
|---------------|--------------|--------------|-------------|------------|-------------|---|--------------|
| •             | <del>-</del> | <del>.</del> |             | :          |             | - | <del> </del> |
| <b>V</b> alue | -            |              | 7           | -          | *           | 4 | 528.0        |

## PROBLEM III.

To find the Value of an Annuity for the Longest of two given Lives.

#### RULE.

"Proceed 'as directed in last problem, using the number from table LXVIII, and the product will be the value.

# EXAMPLE.

What is the value of an annuity of £, 20 for the longest of two lives, the one 25 and the other 40 years, interest 4 per cent.?

 $(G_2)$ 

The tabular number answering to the given years and rate of interest Annuity

Value

**530.0** 

Those who wish farther information on this subject, may consult Dr. Halley's Tracts in the Philosoph. Transactions, Baron Maseres's Treatise on Annuities, Simpson's Select Exercises, Smart's Tables of Interest, De Moivre on the Valuation of Annuities, Dr. Price on Reversionary Payments, Morgan's Doctrine of Annuities and Assurances on Lives, &c.

# TABLES LXIX, LXX, LXXI, LXXII, LXXIII, LXXIV, LXXV.

These tables will be found very useful to Land-surveyors: the manner of using the four first is so obvious as to require no explanation. By table LXXIII, a distance measured on an inclined

plane, may be reduced to horizontal measure, as follows:

Multiply the number in table LXXIII, answering to the given inclination of the plane, by the measured distance; subtract the product (four figures being previously pointed off to the right-hand) from the given distance, and the remainder will be the horizontal distance.

# EXAMPLE.

A distance of 6 chains, 57 links, was measured on an inclined plane, the angle of inclination being 13° 20′. Required the horizontal measure?

The reduction to 19° 20' is .027, which multiplied by 657, the product is 17.737, or 17.7, which subtracted from 657, the remainder is 639.3, the horizontal measure required.

Table LXXIV may be applied to determine the angle contained, between two stations, from a given point: and table LXXV contains the quantity, expressed in inches and decimal parts of an inch, which is to be subtracted from that point on the rod belonging to a level ling instrument, to which the horizontal hair of the telescope of a level is directed, when properly adjusted, that the point may be obtained, which is on a level with the axis of the telescope. In order to render this table more generally useful, it is adapted both to the English and Scots chains.

## TABLE LXXVI.

# Properties of the Platonic Bodies.

A regular solid is that which is contained by like, equal, and regular plane figures, and whose solid angles are all equal: of these there are only five, and they are called *Platonic* bodies from the ancient philosopher Plato. By this table, the surface, solidity, &c. of any of these bodies may be very easily found, as follows:

## PROBLEM I.

## To find the Surface and Solidity of a Platonic Body.

#### RULE.

Multiply the number under surface corresponding to the given body, by the square of the diameter, the product will be the superficial content; and the number under solidity multiplied by the cube of the diameter will give the solid content required.

#### EXAMPLE.

Required the superficial and solid content of a dodecaedron, whose side is 10 feet?

| Tabular surface | = 20.6457788 | - solidity | - 7.6631189       |
|-----------------|--------------|------------|-------------------|
| Square of 10    | = 100        |            | - 1000            |
| Surface -       | 2064.57788   | - solidity | <b>7</b> 663.1189 |

#### PROBLEM II.

Given the Diameter of a Sphere, to find the Side of a Platonic Body that may be inscribed in the Sphere, circumscribed about it, or that is equal to the Sphere.

#### RULE.

Multiply the corresponding number in the table by the diameter of the sphere, and the product will be the side required.

#### EXAMPLE.

Required the side of an octaedron that may be circumscribed about a sphere, whose diameter is 20 inches?

| Tabular number |     |   | • | -  | •. | 1.5  | 22474 |
|----------------|-----|---|---|----|----|------|-------|
| Given diameter | ₹.  | - | - | ٠. | •  | -    | 20    |
| Side required  | ``_ | _ | _ | -  |    | 24.4 | 9480  |

The converse, &c. of these problems may also be easily resolved by means of this table:

#### TABLE LXXVIL

## Areas of Regular Polygons.

This table contains the areas of all regular polygons, from the trigon to the dodecagon inclusive; the side of each being 1. When the side is any other quantity, the area is found by multiplying the tabular number corresponding to the given polygon, by the square of the side of the proposed polygon. Thus, if the side of a pentagon be 50 yards, its area is = 1.7204774 × 2500 = 4301.193.

#### TABLE LXXVIII.

## To reduce English to French Measure, and conversely.

By part first of this table, English measure is reduced to French measure, as used before the revolution; and by part second, French measure is reduced to English. The numbers in column first may represent inches, feet, yards, toises, &c. and column second contains

the corresponding French measure, expressed in inches and decimals of an inch, feet and decimals of a foot, &c. The other two columns are similar to the former. The use of this table will be obvious from the following examples.

Ī.

The height of the mercury in the barometer is 30 415 inches English measure: required its height in French measure?

|       | 30.          | inches | = | 28.14918          |   |                      |
|-------|--------------|--------|---|-------------------|---|----------------------|
| •     | .4           | -      | - | <b>.37</b> 532    |   |                      |
|       | .01          | -      | - | .09383            |   |                      |
|       | <b>.0</b> 05 | •      | - | .00469            |   |                      |
|       |              | •      |   | <del></del>       |   |                      |
| Hence | 30.415       | ==     |   | 28.623 <b>0</b> 2 | = | 28 in. 7 lines .476. |
|       |              |        | 1 | T¥                |   |                      |

How many fathoms are equal to 57069 toises?

#### TABLE LXXIX.

Containing the Measures of the principal Lines and Angles, in regular Fortresses, from Four to Twelve Sides inclusive.

By this table the magistral line of a regular fort may be drawn, or any part of that line, as a bastion, &c.

#### TABLE LXXX.

To veduce the Divisions of the Nintey-six Arch of an Astronomical Quadrant, to Degrees.

The limb of an astronomical quadrant commonly contains two distinct sets of divisions; in one of which the quadrantal arch is divided into 90 degrees, as usual, and in the other into 96 equal parts; which last, upon account of the particular method of dividing it, is always considered as the most accurate. Each of these primary divisions is divided into 8 equal parts, and each of these is divided into 32 equal parts by a subdividing scale; and the difference, in seconds, between the two nearest divisions on the limb and subdividing scale, is found by a micrometer screw. The use of this table, therefore, is to reduce these divisions to degrees, which will be evident from the following example.

Let the apparent zenith distance of the sun's upper limb, by the nintey-six arch be 59 6 8 +  $4\frac{1}{2}$ , required the corresponding number of degrees, &c.?

#### TABLE LXXXI.

#### Climates.

A climate is a portion of the surface of the earth, contained between two circles parallel to the equator, and of such a breadth that the length of the longest day at the parallel nearer the pole, exceeds that of the longest day at the parallel next the equator, by some assigned portion of time.

At the equator the day is always of the same length, namely, 12 hours. At the polar circles, the length of the longest day is 24 hours; and at the poles it is six months: hence, climates are dis-

tinguished into two kinds, namely,

#### HOUR AND MONTH CLIMATES.

The hour climates, therefore, begin at the equator, and end at the polar circles. Now, as the length of the longest day at the extremity of an hour climate nearest the pole, exceeds the length of the longest day at the beginning, or other extremity of that climate by half an hour; and since from the equator to the polar circles, there is an encrease of 12 hours in the length of the longest day; there are, therefore, 24 climates between the equator and each polar circle, and hence 48 hour climates in all.

From what has been said, it is evident, the first hour climate begins at the equator, and ends at that parallel where the length of the longest day is 12 h. 30', which is also the beginning of the second; and the second ends at that parallel where the length of the longest day is 13 hours, which is the commencement of the third; and so on to the polar circle, where the hour climates end, and

the month climates begin.

The month climates begin at the polar circles, and end at the poles': the length of the longest day at the beginning of one climate exceeding that at the beginning of the next, by a month, or 30 days. Since the length of the longest day at the pole is six months, there are, therefore, six month climates between each polar circle and its respective pole; and, therefore, 12 month climates in all.—Hence, the number of hour and month climates together amount to 60.

In table LXXXI are contained the climates; column first contains the number of the climate; the second column, the length of the longest day at the end of each climate; the third, the latitude of the parallel bounding the end of the climate; and the fourth column, the breadth of each climate.

As all the tables of climates hitherto published, which the Author has had an opportunity of consulting, are erroneous; it was, therefore, thought proper to compute this table, which the reader may

verify by the following methods of computation.

## For Hour Climates.

To the log. co-sine of half the length of the longest day at the end of any climate, add the log. co-tangent of 23° 28', the sun's

greatest declination, the sum, rejecting radius, will be the log. tangent of the latitude required.

#### EXAMPLE.

Required the latitude of that parallel at the end of the 4th cli-

The length of the longest day at the end of the fourth climate is 14 hours; the half is 7 hours, which, reduced to degrees, is 105%

Now, half the length of the longest day in degrees 105° 0' co-sine 9.41300 Sun's greatest declination - - 23 28 co-tang. 0.36239

Latitude - 30 48 tang. 9.77539

#### IÌ.

#### For Month Climates.

To the log. co-sine of half the sun's motion in longitude in the given interval, add the sine of the obliquity of the ecliptic, the sum, rejecting radius, will be the co-sine of the required latitude.

Or, let half the number of days in the given climate be reckoned both ways from the time of the solstice; then, the complement of the mean of the declinations of the sun on these days, will be the latitude.

#### EXAMPLE.

Required the latitude of that parallel when the third month climate ends?

The length of the longest day, at the end of the third climate, is three months, of 90 days; the half of which, being subtracted from, and added to the 21st of June, gives May 7th and August 5th. Now, the difference between the longitude of the sun on these days is 2s 26° 4′, the half is 1s. 13° 3′ = 43° 3′

| Half sun<br>Obliquity | 's motion in<br>y of ecliptic | long.   |   | 43° 3′<br>23° 28  | •   | co-sine<br>sine | -          | 9.86377<br>9.6001 <i>2</i> |
|-----------------------|-------------------------------|---------|---|-------------------|-----|-----------------|------------|----------------------------|
| Latitude              |                               | -       | • | 73 5              |     | co-sine         | -          | 9.46387                    |
| Or,                   | Sun's declir                  | nation, |   | y 7th<br>gust 5th | • - |                 | 571<br>521 |                            |
| ,                     | Mean                          | •       | • | •                 | -   | 16              | 55         | •                          |
|                       | Latitude                      |         | - | <u>.</u>          | . + | 73              | ,5.        | •                          |

#### REMARK.

The latitudes of the parallels bounding the month climates in the southern hemisphere, will differ from those in the northern hemisphere.

#### TABLE LXXXII.

## To find the Number of Days contained between any Two Days of the Year.

This table is useful for many purposes, particularly in finding the interest for any given interval, and in various astronomical calculations. The manner of using this table is, by subtracting the number of days answering to the given day of the preceding month, from those answering to that of the following month, increased by 365 days, if necessary; observing, that if the preceding time be before, and the following after the end of February, in leap years, the above interval is to be encreased by one day.

#### Examples.

#### T.

Required the number of days between the 10th February and the 23d August, 1804?

#### TABLE LXXXIII.

Containing the Number of Days between the Old and New Styles, in different Periods.

The first column of this table contains years before Christ, and the second, the number of days of difference between the styles. The other columns are a continuation of the former. Those days having the sign — prefixed, are to be subtracted from the old style, to reduce it to the new; and those having the sign + prefixed, or after the year 200 of Christ, when there was no difference, are to be added to the old stile to reduce it to the new. All the years in this table are leap years in the old stile; but those only having the letter L prefixed, are leap years in the new stile.

#### TABLE LXXXIV.

## Weights and Measures.

This table will be found necessary on many occasions; its use is obvious.

#### TABLE LXXXV.

## Specific Gravities.

If any body be weighed in air, and then in water, and the weight in air being divided by the difference between the weights, the quotient will express the relative weight of the body, with respect to water, which is called its specific gravity. Spring water is taken as the standard, a cubic foot of which weighs  $62\frac{1}{2}$  pounds avoirdupois, or 1000 ounces; and hence the numbers in this table express the number of avoirdupois ounces contained in a cubic foot of each body. Therefore, the weight of any body in the table, whose dimensions are given, may be found; or, if the weight is given, the corresponding number of cubic inches may be ascertained.

#### EXAMPLES.

T.

Required the weight of a block of marble, 8 feet long, 5 broad, and 3 feet thick?

The content of the stone, in cubic feet, is  $\equiv 8 \times 5 \times 3 \equiv 120$  feet; which multiplied by 2703, the specific gravity of marble, the product 324360 is the weight in avoirdupois ounces, or 9 tons I cwt.

II.

What is the content of a block of granite, which weighs 5 tons, 1 cwt. 3 quarters?

The given weight, reduced to ounces, is 182336, which divided by 3500, the specific gravity of granite, the quotient  $52\frac{1}{1.2}$  solid feet, is the required content.

#### TABLE LXXXVI.

Containing the Circumference and Area of a Circle, to a given Diameter.

If the diameter of a circle be below 12, with one decimal annexed, the corresponding circumference and area, expressed in the same measure, are found immediately opposite thereto.

If the given diameter is any whole number between 12 and 120, let the right-hand figure be considered a decimal, and take out the corresponding circumference and area, in the first of which remove the decimal point one place to the right-hand; and in the second it is to be removed two places.

If the given diameter be a multiple of any in the table, take out the circumference and area answering to the part, the first of which being multiplied by the divisor, and the second by the square of the divisor, will give the circumference and area required.

The circumference answering to any diameter, may be found by means of this table, by collecting the terms corresponding to those that make up the diameter. Then, one-fourth of the circumference multiplied by the diameter will be the area.

### EXAMPLES.

T.

Required the circumference and area of a circle, whose diameter is 78?

The given diameter, with one figure pointed off to the right is 7.8, opposite to which, we have the circumference 24.50442, and area 47.78362. Now, the decimal point being removed one place to the right hand, in the circumference, gives 245.0442, and two places in the area, gives 4778.362, the required circumference and area.

II.

Let the diameter of a circle be 256, required the corresponding circumference and area?

The given number exceeds 120; let it, therefore, be divided by some convenient number, as 4, then we have 64, one tenth of which is 6.4.

Now, to diameter 6.4 the circumf. is 20.10619 and area 32.16991 Hence, to diameter 64 the circumf. is 201.0619 and area 3216.991 Multiply the circumference by - 4 and area by 16

Circumference - 804.2476, Area 51471.856

#### 111

Required the circumference and superficial content of a circle, whose diameter is 437?

| To diameter<br>To diameter                  | - | 430<br>7  | : | the circumference is<br>the circumference is | : | 1350.885<br>21.99 <b>i</b>    |   |

#### Superficial content

#### TABLE LXXXVII.

Containing the Diameter and Area of a Circle, whose Circumference is given.

The same rules answer for this, as for the preceding table, and therefore, scarcely requires any farther illustration.

#### TABLE LXXXVIII.

To reduce the Diameters of Casks of the different Varieties, to a Mea Diameter.

The forms of casks, in consequence of the various degrees of curvature of the staves, are very different; and, therefore, for the more ready ascertaining their contents as nearly, and with as little trouble, as possible, they are generally distinguished into four forms or varieties; to one of which, any cask to be measured, is to be referred.

If the staves of the cask be much curved, it is considered to be the middle frustum of a spheroid, and contains more than any other cask, whose length, bung and head diameters are the same.

If the staves are straight between the bung and head of the cask, it is considered to be composed of the lower frustums of two equal cones; and contains less than any other cask, whose length, and bung, and head diameters are the same.

Between these, two other varieties are introduced. That nearest to the spheroid is taken to be the middle frustum of a parabolic spindle, and the other is considered to be the lower frustums of two equal parabolic conoids.

When the variety to which the cask belongs is ascertained, the bung and head diameters are to be reduced to a mean diameter, and hence the contents of the cask may be found as follows:

Find the difference between the bung and head diameters; then, in the table, and variety to which the cask belongs, opposite to the inches in the side column, and under the tenths of an inch, in the difference, at the top, is a number, which added to the head diameter, the sum is the mean diameter.

Now, to twice the logarithm of the mean diameter, add the logarithm of the length of the cask in inches; and to the sum add the constant logarithm 7.44491, if the content is wanted in ale gallons; or 7.53165, if in wine gallons; the sum, rejecting 10 in the index, will be the content of the cask.

#### EXAMPLE.

Let the length of a cask of the first variety be 42 inches, bung diameter 31.0 inches, and head diameter 24.7. Required the content of the cask in ale and wine gallons?

| Bung diameter<br>Head diameter | • | • | - | - |   | <b>-</b> | \$1.0 |
|--------------------------------|---|---|---|---|---|----------|-------|
| Head diameter                  | - | • | - |   | - | =        | 24,7  |
| Difference                     |   | _ | _ |   |   | -        | 6.3   |

Now, opposite to 6, and under 3, in the table of the first variety, is 4.06, which added to the head diameter, the sum 28.76 is the mean diameter. Then,

| Mean diameter 28.76 log. 1.<br>Length - 42 log. | .45879 ; | × 2 =          | 2.91758<br>1.62325                 |                  |                                   |
|---|----------|----------------|------------------------------------|------------------|-----------------------------------|
| Sum Constant log. for ale gallons               |          |                | <b>4.54</b> 083<br><b>7.44</b> 491 | for wine gall.   | <b>4.54083</b><br>7.5316 <b>5</b> |
| Content in ale gallons -                        | 96.77    | , <del>.</del> | 1.98574.                           | Wine gal, 118.16 | 2.07243                           |

#### TABLE LXXXIX.

#### Remarkable Æras and Events.

This table contains some remarkable epochs and events, reduced to the Julian period, the common received opinion of the creation of the world, and to that of the birth of Christ. The first of these was invented by J. Scaliger, and is the product of the cycles of the sun, moon, and indiction; that is, of 28.19 and 15, = 7980 years. Its commencement is placed prior to the creation of the world, and, therefore, includes all the other areas and events hitherto. When this period is completed, which will be in the year of Christ 3267 = 7980 — 4713, the second Julian period will begin.

By means of this table, the year of any other ara, &c. may be easily found, as follows.

#### EXAMPLES.

#### I.

Required the year of the zera of Nabonassar, answering to the year of Christ 1804?

| Given year of Christian æra<br>Æra of Nabonassar before Christ |               | or of the |          |   |      |
|--|---------------|-----------|----------|---|------|
| Year of the zra of Nabonassar                                  | 25 <b>5</b> 0 |           | <b>.</b> | - | 2550 |

Required the year of the Hegira corresponding to the year 1804 of the Christian æra?

|   | iven year of the Christian | n æra | - | - | 180 <b>4</b> |
|---|----------------------------|-------|---|---|--------------|
| A | Era of the Hegira `        | -     | • | ٦ | - 662        |
| Y | car of the Hegira -        |       | • | - | 1142         |

Since the Julian period is the product of the cycles of the sun, moon, and indiction; if, therefore, the years of these cycles answering to any year be given, the corresponding year of the Julian

period may be found as follows:

Multiply the constant number 4845 by the given year of the cycle of the sun, 4200 by that of the cycle of the moon, and 6916 by the year of the cycle of the indiction, and the sum of these three products being divided by 7980, the remainder will be the year of the Julian period.

EXAMPLE.

Let the solar cycle be 21, lunar cycle 19, and indiction 7: required the corresponding year of the Julian period?

Constant number for sun = 4845 × 21 = 101745 for moon = 4200 × 19 = 79800 for indiction = 6916 × 7 = 48412

> 7980)229957(28 15960 70357 63840

Corresponding year of the Julian period the year 1804 of the Christian æra. 5517, to which answers

#### TABLE XC.

## Logistic Logarithms.

A table of Logistic logarithms was first given by Mr. Jeremiah Shakerly, in his Tabula Britannica; and since Mr. Thomas Street has given another table of Logistic logarithms, in his Astronomia Carolina, of a different and more commodious form. These logarithms greatly facilitate those calculations where sexagesimals are concerned; which is almost always the case in taking, from astronomical tables, the equation answering to a given argument which differs by 60 minutes or seconds.

In using this table, if the first term of the analogy be 60, the sum of the logistic logarithm of the other two terms will be the logistic logarithm of the answer. And if the second or third terms be 60, the logistic logarithm of the other term subtracted from the logistic logarithm of the first, the remainder will be the logistic

logarithm of the answer.

## Examples.

Required the equation of the orbit of Jupiter, by M. de Lambre's tables, the mean anomaly being 5 s. 10° 51' 25"?

Tabular difference - 5' 43" - Logistic log. 1.0210

Excess above tab. anom. 51 25 - Logistic log. 0.0670

Proportional part - 4 54

Equation to 5s. 10° - 1 59 47

Equation to 5s. 10° 51' 25" 1 54 53

#### II.

Required the reduction, from the Cambridge tables, answering to a distance of 51°, the moon's altitude being 33°, and that of the star 12° 38'?

| 1 | o dist. 51°, alt. ) 33°, and alt.                | * 12° | , rcd. = | = 11'59"<br>10 12 |               |                  |
|---|--|-------|----------|-------------------|---------------|------------------|
|   | Difference                                       | -     | -        | 1 21<br>38 0      | logistic log. | 1.6478<br>0.1984 |
|   | Proportional part -<br>Reduction to alt 12°, &c. | -     | -        | 0 51<br>· 11 38   | ÷             | 1.8462           |
|   | Required reduction -                             | -     | -        | 10 42             | * • •         |                  |

#### III.

Required the altitude and longitude of the nonagesimal for Greenwich, by Dr. Maskelyne's tables; the right ascension of the meridian being 77° 28′ 42″?

| Alt. non. to 77°=        | = 61° 49′ 0″<br>61 52 40 | Long non. to 77 = 78                                 |   |    | 48/ 20/<br>30 40 | •                            |
|--------------------------|--------------------------|--|---|----|------------------|------------------------------|
| Difference<br>Excess -   | 3,40<br>28 42            | logis. l. 1.2139 Difference<br>logis. l. 3203 Excess |   |    | 42 20<br>28 42   | l. log. 1498<br>l. log. 3203 |
| Prop. part<br>Alt. to 77 | - 1 45<br>61 49 O        | 1.5342 Prop. part<br>Long. non. to 77                | 2 | 20 | 20 20<br>48 20   | 4701                         |
| Altitude                 | 61 50 45                 | Longitude  | 2 | 21 | 8 40             |                              |

Since logistic logarithms are analogous to proportional logarithms, those who wish more information, are referred to the second volume of the Author's Treatise on the Longitude.

#### TABLE XCI.

## For the Construction of Water Mills.

This table was given by Mr. Ferguson, in his Lectures on Select Subjects, for which he gives the following directions.

"The water wheel must not be too large, for if it be, its motion will be too slow; nor too little, for then it will want power: and for a mill to be in perfection, the floats of the wheel ought to move with a third part of the velocity of the water, and the stone to turn round once in a second of time.

"In order to construct a mill in this perfect manner, observe the following rules."

T.

Measure the perpendicular height of the fall of water, in feet, above that part of the wheel on which the water begins to act; and call that the height of the fall.

#### II.

Multiply this constant number 64.2882 by the height of the fall, in feet, and the square-root of the product shall be the velocity of the water at the bottom of the fall, or the number of feet that the water there moves per second.

#### III.

Divide the velocity of the water by 3, and the quotient shall be the velocity of the float boards of the wheel; or the number of feet they must each go through in a second, when the water acts upon them so as to have the greatest power to turn the mill.

#### IV.

Divide the circumference of the wheel, in feet, by the velocity of its floats, in feet, per second, and the quotient shall be the number of seconds in which the wheel turns round.

#### V

By this last number of seconds divide 60, and the quotient shall be the number of the turns of the wheel in a minute.

#### VI.

Divide 60, (the number of revolutions the mill-stone ought to have in a minute), by the number of turns of the wheel in a minute, and the quotient shall be the number of turns the mill-stone ought to have for one turn of the wheel.

#### VII.

Then, as the number of turns of the wheel in a minute, is to the number of turns of the mill-stone in a minute; so must the staves in the trundle, be to the number of cogs in the wheel, in the nearest whole numbers that can be found.

By these rules the following table is calculated, the diameter of the water-wheel being supposed to be 18 feet, which it is appre-

hended may be a good size in general.

To construct a mill by this table, find the height of the fall of water in the first column, and opposite to that height, in the sixth column is the number of cogs in the wheel; and in the seventh, the staves in the trundle, for causing the mill-stone to make about 60 revolutions in a minute, as near as possible, when the wheel goes with a third part of the velocity of the water. And it appears by the last column, that the number of cogs in the wheel, and staves in the trundle, are so near the truth for the required purpose, that the least number of revolutions of the mill-stone in a minute is between 59 and 60, and the greatest number never amounts to 61.

Such a mill as this, with a fall of water about  $7\frac{1}{2}$  feet, will require about 32 hogsheads every minute to turn the wheel with a third part of the velocity with which the water falls; and to overcome the resistance arising from the friction of the geers and attrition of the stones in grinding the corn.

#### TABLE XCII.

## For the Construction of Pumps.

This table was calculated by Mr. Booth, in which Mr. Ferguson made a few alterations, and extended it from 80 to 100 feet. In this calculation, Mr. Booth supposed the handle of the pump to be a lever encreasing the power five times; and had often found that a man can work a pump four inches diameter, and 30 feet high, and discharge  $27\frac{1}{2}$  gallons of water, English wine measure, in a minute. Now, if it be required to find the diameter of a pump, that shall raise water, with the same ease, from any other height above the surface of the well, find that height in the first column, and opposite thereto in the second, is the diameter or width of the pump, and in the third column is the quantity of water which a man of ordinary strength can discharge in a minute.

The wideness or narrowness of the pump, in any other part besides that in which the piston works, does not make the pump more or less difficult to work, except what difference may arise from the friction of water in the bore; which is always greater in a narrow bore than in a wide one, because of the greater velocity of the water.

#### TABLE XCIII.

This table, which was constructed by that celebrated mathematician, Mr. William Emerson, contains the length of a pendulum vibrating seconds at every fifth degree of latitude, together with the length of a degree of latitude, in English miles. For an account of the pendulum, its various properties, &c. the reader may consult that article, by the Author of this, in the Encyclopedia Britannica.
